**Day one**  
and you're ready

Day one. It's the moment you've been waiting for. When you prove your worth, meet new challenges, and go looking for the next one. It's when your dreams take shape. And your expectations can be exceeded. From the day you join us, we're committed to helping you achieve your potential. So, whether your career lies in assurance, tax, transaction, advisory or core business services, shouldn't your day one be at Ernst & Young?

**What's next for your future?**

# Preface to Vol. 3

This is Vol. 3 of the book “**Software Solutions to Problems on Heat Transfer**”.

In Vol. 1, problems on various aspects of CONDUCTION heat transfer were solved with Mathcad, EES, FEHT and EXCEL.

Vol. 2 contained solved problems on the topics of CONVECTION (i.e. Forced convection, Natural or Free convection).

**Present Vol. viz. BOILING & CONDENSATION contains problems solved on following sub-topics:**

## **Vol. 3: BOILING & CONDENSATION:**

### **3.1. Boiling heat transfer:**

3.1. Boiling heat transfer Equation summary

Problems on: Pool Boiling and Flow Boiling

Problems solved with Mathcad

Problems solved with EES

Problems solved with EXCEL

### **3.2. Condensation heat transfer:**

3.2. Condensation heat transfer Equation summary

Problems on: Condensation on Vertical plates and Cylinders, outside of Horizontal cylinders, Horizontal Tube Banks in a vertical tier, inside horizontal tubes etc.

Problems solved with Mathcad

Problems solved with EES

Problems solved with EXCEL

References

**Here also, problems are solved using the popular software, viz. “Mathcad”, “Engineering Equation Solver (EES)”, and MS EXCEL spreadsheet. Comments are included generously in the codes so that the logic behind the solutions is clear. An introductory chapter in Part-I gives a brief overview of the software used.**

As in Vol. I and II, emphasis is given not only to solving a given problem but also to parametric analysis and graphical representation of results. Advantage of using Software to solve a variety of problems thus becomes evident. Also, problems with EXCEL spreadsheet are solved in greater details with relevant screen shots for immediate help to students, since EXCEL is available in practically every Personal Computer.

**Acknowledgements:** Firstly, I thank my students, since it is they who inspired me and motivated me. Next, my thanks are due to the authorities at St. Joseph Engineering College, for their constant encouragement.

Also, my sincere thanks to **Bookboon.com** for publishing this book on the Internet. **Ms. Sophie** and her editorial staff have to be specially mentioned for their cooperation, suggestions and support.

Finally, my heartfelt appreciation to **my wife, Kala**, for her unfailing and thoughtful support and encouragement.

M. Thirumaleshwar

August 2013

In the past four years we have drilled

# 81,000 km

That's more than **twice** around the world.

**Who are we?**  
We are the world's leading oilfield services company. Working globally—often in remote and challenging locations—we invent, design, engineer, manufacture, apply, and maintain technology to help customers find and produce oil and gas safely.

**Who are we looking for?**  
We offer countless opportunities in the following domains:

- Engineering, Research, and Operations
- Geoscience and Petrotechnical
- Commercial and Business

If you are a self-motivated graduate looking for a dynamic career, apply to join our team.

**What will you be?**

**Schlumberger**

# About the Author

Dr. M. Thirumaleshwar graduated in Mechanical Engineering from Karnataka Regional Engineering College, Surathkal, Karnataka, India, in the year 1965. He obtained M.Sc (cryogenis) from University of Southampton, U.K. and Ph.D.(cryogenics) from Indian Institute of Science, Bangalore, India.

He is a Fellow of Institution of Engineers (India), Life Member, Indian Society for Technical Education, and a Foundation Fellow of Indian Cryogenics Council.

He has worked in India and abroad on large projects in the areas involving heat transfer, fluid flow, vacuum system design, cryo-pumping etc.

He worked as Head of Cryogenics Dept. in Bhabha Atomic Research Centre (BARC), Bombay and Centre for Advanced Technology (CAT), Indore, from 1966 to 1992.

He worked as Guest Collaborator with Superconducting Super Collider Laboratory of Universities Research Association, in Dallas, USA from 1990 to 1993.

He also worked at the Institute of Cryogenics, Southampton, U.K. as a Visiting Research Fellow from 1993 to 1994.

He was Head of the Dept. of Mechanical Engineering, Fr. Conceicao Rodrigues Institute of Technology, Vashi, Navi Mumbai, India for eight years.

He also worked as Head of Dept. of Mechanical Engineering and Civil Engineering, and then as Principal, Vivekananda College of Engineering and Technology, Puttur (D.K.), India.

**Presently, he is Professor and coordinator of Post-graduate program in the Dept. of Mechanical Engineering in St. Joseph Engineering College, Vamanjoor, Mangalore, India.**

A book entitled “**Fundamentals of Heat and Mass Transfer**” authored by him and published by M/s Pearson Education, India (2006) **has been adopted as a Text book** for third year engineering students by the Visweswaraya Technological University (V.T.U.), Belgaum, India.

He has also written and published three book-lets entitled as follows:

1. Towards Excellence... How to Study (A Guide book to Students)
2. Towards Excellence... How to teach (A guide book to Teachers)
3. Towards Excellence... Seminars, GD's and Personal Interviews  
(A guide book to Professional and Management students)

Dr. M. Thirumaleshwar has attended several National and International conferences and has more than 50 publications to his credit.

Hellmann's is one of Unilever's oldest brands having been popular for over 100 years. If you too share a passion for discovery and innovation we will give you the tools and opportunities to provide you with a challenging career. Are you a great scientist who would like to be at the forefront of scientific innovations and developments? Then you will enjoy a career within Unilever Research & Development. For challenging job opportunities, please visit [www.unilever.com/rjjobs](http://www.unilever.com/rjjobs).

Unilever

# About the Software used

Following three software are used while solving problems in this book:

1. Mathcad 2001 (Ref: [www.ptc.com](http://www.ptc.com))
2. Engineering Equation Solver (EES) (Ref: [www.fchart.com](http://www.fchart.com)), and
3. Finite Element Heat Transfer (FEHT) (Ref: [www.fchart.com](http://www.fchart.com))
4. MS EXCEL – (2007) Spreadsheet (Ref: Microsoft)

Trial versions of the first three software and detailed Instruction Manuals may be downloaded from the websites indicated. EXCEL is a very popular spreadsheet which comes bundled with MS OFFICE software, and is generally available in every computer.

**See Part-I of this book for brief introduction to these four software.**

While the information given there is enough to get going, for detailed instructions one should consult the respective Instruction manuals.

# To the Student

*Dear Student:*

I would like to remind you that Heat Transfer is an important subject useful in many branches of engineering. It is also a subject in which you can score high marks in the examinations, since the question paper generally consists of derivations and numerical problems, almost in the ratio 50:50. Therefore, it requires that:

- (i) you are thorough with the derivations, and
- (ii) skillful in solving numerical problems.

To be thorough with derivations, you should refer to well known, standard Text books on the subject of Heat Transfer (See References at the end of this book). **And, to develop your skill in solving problems... well, that is where I think that this book will help you.**

This book contains solutions to problems on heat transfer using four popular softwares, viz. Mathcad, Engineering Equation Solver (EES), Finite Element Heat Transfer (FEHT), and EXCEL spreadsheet. Trial versions of Mathcad, EES and FEHT can be downloaded from the websites indicated. EXCEL, which is a part of MS OFFICE, is generally pre-installed in most of the Personal Computers. Problems are chosen from the University question papers and standard heat transfer Text books.

Use of Software in solving problems has many advantages:

1. It helps in logical thinking
2. Problems are solved quickly and accurately
3. Parametric solutions (or 'what-if' solutions) are obtained easily
4. Solutions can be presented in tabular or graphical form, very easily and quickly
5. Once a particular type of problem is solved, solving a similar problem with different data input becomes very easy
6. Ease of getting solutions to problems in tabular or graphical form creates further interest and curiosity on the subject in the minds of students and encourages them to be creative and work further

### How to use this Book?

You need not worry if you don't know about these softwares. Since each problem is solved systematically step by step, and is well commented, just reading through the solution will make the logic of the solution clear to you. That is the most important thing in solving the problems. ***Then, you must work out the problem yourself, by hand or using the software.*** Of course, use of software has the above-mentioned advantages. *Simply reading the book won't do.* Have your favorite Text book nearby, in case you need to refer to it for any formulas or clarifications. There is no other 'easy method'.

As they say, *'there is no gain without pain!'*

Lastly, I would like to tell you how greatly I enjoyed solving the problems presented in this book using the softwares mentioned.

I hope that you too will enjoy as much as I did in solving these problems and get benefitted.

Good Luck!

## **Vol. 2: CONVECTION**

### **Chapter 2: CONVECTION:**

#### **Part-I:**

#### **2A1. Forced convection:**

2A1. Convection Equation summary

2A1.1. Boundary layer fundamentals, Flow over Flat plates, Momentum – heat transfer Analogy

2A1.2. Flow across Cylinders and Spheres

2A1.3. Flow across Tube banks

2A1.4. Flow inside Tubes and ducts

#### **Part-II:**

#### **2A2. Natural (or Free) convection:**

2A2.1. Natural convection from Vertical plates and Cylinders

2A2.2. Natural convection from Horizontal plates and Spheres

2A2.3. Natural convection from Enclosed spaces

2A2.4. Natural convection from Rotating disks and Spheres

2A2.5. Natural convection from Finned surfaces

2A2.6. Combined Natural and Forced convection

# 3 Boiling And Condensation

## Learning objectives:

1. In Chapter 2, while dealing with convection (either Natural or Forced), the fluid involved was homogeneous and in single phase.
2. But, there are many important practical cases which involve heat transfer with a change of phase of the fluid, e.g. boiling where the liquid changes to vapour and condensation where the vapour condenses into a liquid.
3. Some of the applications of boiling and condensation are:
  - i) Evaporators and condensers of a vapour compression refrigerating system
  - ii) Boilers and condensers of a steam power plant
  - iii) Reboilers and condensers of distillation columns of cryogenic and petrochemical plants
  - iv) Cooling of nuclear reactors and rocket motors
  - v) Process heating and cooling etc.
4. Unique features of boiling and condensation are:
  - i) heat transfer, practically at a constant temperature, because of change of phase
  - ii) latent heat and surface tension come into play in addition to buoyancy driven flow effects, resulting in larger heat transfer rates and heat transfer coefficients compared to the usual free or forced convection
  - iii) *high heat transfer rates* with small temperature difference
5. We have mostly empirical relations for Boiling and Condensation. We will also need properties of Water and steam (at 1 atm. and sat. conditions), since in most of the cases we deal with water. Of course, there are other cases where boiling or condensation of other fluids, such as refrigerants or cryogenic fluids also have to be dealt with.
6. We will solve problems with these empirical relations and the functions for properties of water, written in EES, Mathcad or EXCEL.

### 3.1 Boiling:

#### Formulas used:

#### 1. Boiling regimes and boiling curve: (Ref. 2)

For Water at 1 atm:

In general, four different boiling regimes are observed depending upon the *excess temperature* ( $\Delta T_e$ ) imposed, viz.

- i) natural convection boiling ( $\Delta T_e$  upto about 5 deg.C)
- ii) nucleate boiling ( $\Delta T_e$  from 5 deg to about 30 deg. C)
- iii) transition boiling ( $\Delta T_e$  from 30 deg to about 120 deg. C), and
- iv) film boiling ( $\Delta T_e$  beyond 120 deg. C)

#### 2. Heat transfer correlations for pool boiling: (Ref: 1)

**2.1 Natural convection boiling regime:**( i.e. up to an excess temperature of about 5 deg. C). In this regime, the correlations already presented in the previous chapter on ‘Natural (or, Free) convection’ may be used.

**2.2 Nucleate boiling regime:** (i.e. excess temperature varying from about 5 deg. up to about 30 deg. C).

Correlation proposed by Rohsenow in 1952, is the most widely used one, for heat flux in the nucleate boiling regime:

$$q_{\text{nucleate}} = \mu_L \cdot h_{fg} \cdot \left[ \frac{g \cdot (\rho_L - \rho_V)}{\sigma} \right]^{\frac{1}{2}} \cdot \left[ \frac{C_{pL} \cdot (T_s - T_{\text{sat}})}{C_{sf} \cdot h_{fg} \cdot \text{Pr}_L^n} \right]^3 \quad \text{W/m}^2 \dots \dots (11.5)$$

- where,  $q_{\text{nucleate}}$  = nucleate boiling heat flux, W/m<sup>2</sup>  
 $\mu_L$  = viscosity of liquid, kg/ (m.s)  
 $h_{fg}$  = enthalpy of vapourization, J/kg  
 $g$  = gravitational acceleration, m/s<sup>2</sup>  
 $\rho_L$  = density of liquid, kg/m<sup>3</sup>  
 $\rho_V$  = density of vapour, kg/m<sup>3</sup>  
 $C_{pL}$  = Sp. Heat of liquid, J/(kg.C)  
 $\sigma$  = surface tension of liquid – vapour interface, N/m  
 $T_s$  = surface temperature of heater, deg.C  
 $T_{\text{sat}}$  = saturation temperature of fluid, deg.C  
 $C_{sf}$  = a constant depending upon the specific surface-fluid combination  
 $\text{Pr}_L$  = Prandtl number of liquid  
 $n = 1$  for water, and 1.7 for all other liquids

# Grant Thornton—<sup>REALLY</sup> a great place to work.

We're proud to have been recognized as one of Canada's Best Workplaces by the Great Place to Work Institute™ for the last four years. In 2011 Grant Thornton LLP was ranked as the fifth Best Workplace in Canada, for companies with more than 1,000 employees. We are also very proud to be recognized as one of Canada's top 25 Best Workplaces for Women and as one of Canada's Top Campus Employers.

Priyanka Sawant  
Manager

Audit • Tax • Advisory  
[www.GrantThornton.ca/Careers](http://www.GrantThornton.ca/Careers)

© Grant Thornton LLP. A Canadian Member of Grant Thornton International Ltd

Subscripts L and V refer to liquid and vapour respectively.

Experiments show that nucleate boiling heat flux is not very much dependent on the geometry or orientation of the heater surface.

**Therefore, the correlation given above is valid for flat plates, cylinders and other geometries.**

**Since water is one of the most common fluids used, it is useful to have its surface tension and the constant  $C_{sf}$  for water – surface combination, readily available.**

Surface tension and latent heat of water at a few temperatures are given in Table 11.1 below:

Sat. temp. (T <sub>sat</sub> ), deg.C	Surface tension ( $\sigma$ ), N/m	Latent heat (h <sub>fg</sub> ), kJ/kg
0	0.0755	2500.8
20	0.0729	2453.7
40	0.0695	2406.2
60	0.0661	2357.9
80	0.0627	2308.3
100	0.0589	2256.7
150	0.0487	2113.4
200	0.0378	1939.3
250	0.0261	1714.7
300	0.0143	1406.2
350	0.0036	916.1
374	0.0	0.0

**Table 11.1:**  $\sigma$  and  $h_{fg}$  for water

**Also, surface tension of water ( $\sigma$ ) can be quickly determined by the following equation:**

$$\sigma = 0.0808 * (1 - 0.00267 * T), \text{ N/m where T is in deg. C}$$

---

Experimentally determined values of constant  $C_{sf}$  for a few liquid-surface combinations are given in Table 11.2:

Fluid and surface	$C_{sf}$
<b>Water-copper:</b>	
Scored surface	0.0068
Polished surface	0.0130
<b>Water-stainless steel:</b>	
Teflon coated surface	0.0058
Ground & polished surface	0.0068
Mechanically polished surface	0.0130
Chemically etched surface	0.0130
<b>Water-brass</b>	0.0060
<b>Water-nickel</b>	0.0060
<b>Water-platinum</b>	0.0130
<b>n-pentane-copper:</b>	
Lapped surface	0.0049
Polished surface	0.0154
<b>n-pentane-chromium</b>	0.0150
<b>Ethyl alcohol-chromium</b>	0.0027

**Table 11.2:**  $C_{sf}$  for a few liquid-surface combinations

Note that Rohsenow eqn. (11.5) is applicable for clean surfaces and for relatively smooth surfaces.

To calculate the heat flux in nucleate boiling, Collier recommends the following eqn. which is simpler to use as compared to eqn. (11.5):

$$q_{\text{nucleate}} = 0.000481 \cdot \Delta T_e^{3.33} \cdot P_{\text{cr}}^{2.3} \cdot \left[ 1.8 \cdot \left( \frac{P}{P_{\text{cr}}} \right)^{0.17} + 4 \cdot \left( \frac{P}{P_{\text{cr}}} \right)^{1.2} + 10 \cdot \left( \frac{P}{P_{\text{cr}}} \right)^{10} \right]^{3.33} \quad \text{W/m}^2 \dots (11.7)$$

where  $\Delta T_e$  is the excess temp. in deg. C, P is the operating pressure in atm.,  $P_{\text{cr}}$  is the critical pressure in atm.

Based on Russian literature, following calculation formulas are recommended specifically for water in nucleate boiling, in the pressure range 0.2–100 ata:

$$h_{\text{nucleate}} = 3.133 \cdot q^{0.7} \cdot P^{0.15} \quad \text{W/(m}^2 \cdot \text{C)} \dots \text{for water} \dots (11.10, a)$$

and,

$$h_{\text{nucleate}} = 45.054 \cdot \Delta T^{2.33} \cdot P^{0.5} \quad \text{W/(m}^2 \cdot \text{C)} \dots \text{for water. (11.10,b)}$$

In the above eqns.  $q$  is the heat flux in  $\text{W/m}^2$ ,  $P$  is the pressure in bar, and  $\Delta T$  is the excess temp. in deg.C.

**Peak (or, maximum) heat flux in nucleate pool boiling:**

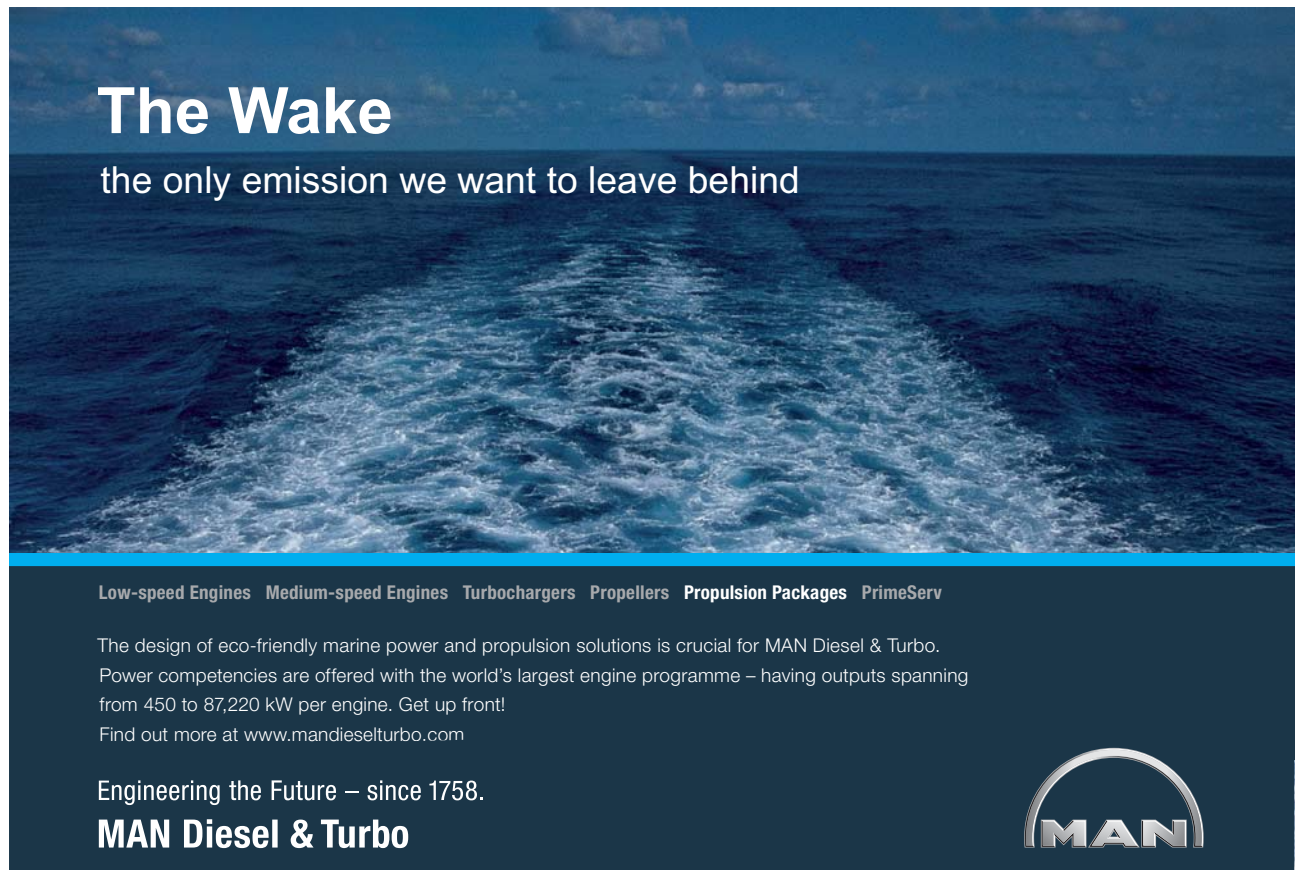

Leinhard and Dhir (1973) give the following correlation for peak heat flux in nucleate pool boiling:

$$q_{\text{max}} = C_o \cdot h_{\text{fg}} \cdot \rho_V \left[ \frac{\sigma \cdot g \cdot (\rho_L - \rho_V)}{\rho_V^2} \right]^{\frac{1}{4}} \quad \text{W/m}^2 \dots (11.11)$$

where  $C_o = 0.149$  for a large horizontal surface

and,  $C_o = 0.116$  for a large horizontal cylinder

**Unlike the nucleate boiling flux, peak heat flux depends on heater geometry and orientation.**

**The Wake**  
the only emission we want to leave behind

Low-speed Engines Medium-speed Engines Turbochargers Propellers Propulsion Packages PrimeServ

Engineering the Future – since 1758.  
**MAN Diesel & Turbo**

 [Click on the ad to read more](#)

Another relation for **peak heat flux on horizontal cylinders**, which fits experimental data very well, is presented by Sun and Lienhard:

$$\frac{q_{\max}}{q_{\max F}} = 0.89 + 2.27 \cdot \exp(-3.44 \cdot \sqrt{R'}) \quad \text{W/m}^2 \dots \text{for } 0.15 < R' < 3.47 \dots (11.12, a)$$

$$\frac{q_{\max}}{q_{\max F}} = 0.894 \quad \text{W/m}^2 \dots \text{for } R' > 3.47 \dots (11.12, b)$$

where  $R'$  is a dimensionless radius defined as:

$$R' = R \cdot \left[ \frac{g \cdot (\rho_L - \rho_V)}{\sigma} \right]^{\frac{1}{2}}$$

and  $q_{\max F}$  is the peak heat flux on an infinite horizontal plate, given as:

$$q_{\max F} = 0.131 \cdot \sqrt{\rho_V \cdot h_{fg}} \cdot \left[ \sigma \cdot g \cdot (\rho_L - \rho_V) \right]^{\frac{1}{4}} \quad \text{W/m}^2 \dots \text{for infinite horizontal plate} \dots (11.13)$$

Cengel (Ref. 2) gives following relation of Zuber and a Table due to Lienhard et al for Max. heat flux:

$$q_{\max} = C_{cr} h_{fg} [\sigma g \rho_v^2 (\rho_l - \rho_v)]^{1/4} \quad (10-3)$$

**TABLE 10-4**

Values of the coefficient  $C_{cr}$  for use in Eq. 10-3 for maximum heat flux (dimensionless parameter  $L^* = L[g(\rho_l - \rho_v)/\sigma]^{1/2}$ )

Heater Geometry	$C_{cr}$	Charac. Dimension of Heater, $L$	Range of $L^*$
Large horizontal flat heater	0.149	Width or diameter	$L^* > 27$
Small horizontal flat heater <sup>1</sup>	$18.9K_1$	Width or diameter	$9 < L^* < 20$
Large horizontal cylinder	0.12	Radius	$L^* > 1.2$
Small horizontal cylinder	$0.12L^{*-0.25}$	Radius	$0.15 < L^* < 1.2$
Large sphere	0.11	Radius	$L^* > 4.26$
Small sphere	$0.227L^{*-0.5}$	Radius	$0.15 < L^* < 4.26$

<sup>1</sup> $K_1 = \sigma/[g(\rho_l - \rho_v)A_{heater}]$

**Minimum heat flux:**

This occurs at point D in Fig. (11.2); minimum heat flux represents the lower limit of heat flux in film boiling. For a **large, horizontal plate**, Zuber derived the following relation (modified by Berenson in 1961) for minimum heat flux:

$$q_{\min} = 0.09 \rho_V h_{fg} \left[ \frac{\sigma \cdot g \cdot (\rho_L - \rho_V)}{(\rho_L + \rho_V)^2} \right]^{\frac{1}{4}} \quad \text{W/m}^2 \dots (11.15)$$

**Film boiling:**

Heat transfer coefficient in stable film boiling regime on a horizontal cylinder or sphere is predicted by Bromley’s correlation:

$$h_{\text{film}} = C_o \left[ \frac{g \cdot \rho_V (\rho_L - \rho_V) \cdot h'_{fg} \cdot k_V^3}{\mu_V (T_s - T_{\text{sat}}) \cdot L} \right]^{\frac{1}{4}} \quad \text{W/(m}^2 \cdot \text{C)} \dots (11.16)$$

where  $h'_{fg} = h_{fg} + 0.4 \cdot C_p V (T_s - T_{\text{sat}})$

$C_o = 0.62$  and  $L = D$  ....for a horizontal cylinder

$C_o = 0.67$  and  $L = D$  ....for a sphere

For a very large diameter tube (diameter D) or a horizontal surface, eqn. (11.16) is valid, with the following value for  $C_o$  (Westwater and Breen, 1962):

$$C_o = \left( 0.59 + \frac{0.69 \lambda}{D} \right) \quad \text{and,} \quad L = \lambda$$

$$\text{and,} \quad \lambda = 2 \cdot \pi \cdot \left[ \frac{\sigma}{g \cdot (\rho_L - \rho_V)} \right]^{\frac{1}{2}}$$

Note that for a horizontal surface,  $C_o = 0.59$ , since  $D \rightarrow \infty$

Vapour properties in eqn. (11.16) are evaluated at the *mean film temperature*,  $T_f = (T_s + T_{\text{sat}})/2$ , and at a pressure  $P_{\text{sat}}$  corresponding to temp  $T_{\text{sat}}$ .

As stated earlier, during stable film boiling, at high temperatures (> 300 C), thermal radiation effects become significant and Bromley suggested using an overall heat transfer coefficient given by:

$$h = h_{\text{film}} + 0.75 h_{\text{rad}} \quad \dots(11.17)$$

and,  $h_{\text{rad}}$  is given by:

$$h_{\text{rad}} = \frac{\sigma \cdot \varepsilon \cdot (T_s^4 - T_{\text{sat}}^4)}{(T_s - T_{\text{sat}})} \quad \text{W/(m}^2\cdot\text{C)} \dots(11.18)$$

where  $\sigma = 5.67 \cdot 10^{-8} \quad \text{W/(m}^2\cdot\text{K}^4)$ ....Stefan-Boltzmann const.

and,  $\varepsilon$  is the emissivity of the heated surface

**Also, remember that in eqn. (11.18), the temperatures  $T_s$  and  $T_{\text{sat}}$  must be in Kelvin.**

# CAREER KICKSTART

An app to keep you in the know

Whether you're a graduate, school leaver or student, it's a difficult time to start your career. So here at RBS, we're providing a helping hand with our new Facebook app. Bringing together the most relevant and useful careers information, we've created a one-stop shop designed to help you get on the career ladder – whatever your level of education, degree subject or work experience.

And it's not just finance-focused either. That's because it's not about us. It's about you. So download the app and you'll get everything you need to know to kickstart your career.

So what are you waiting for?

Click [here](#) to get started.

Heat flux in stable film boiling is easily calculated, once the heat transfer coeff. is determined. i.e.

$$q_{\text{film}} = h \cdot (T_s - T_{\text{sat}}) \quad \text{W/m}^2 \dots (11.19)$$

**Simplified correlations for boiling with water:**

Since water is one of the most commonly used fluids in practice, it is useful to have some simplified correlations for boiling water.

Jakob and Hawkins (1957) presented following simple relations for water boiling at atmospheric pressure on submerged surfaces:

Type of surface	Range of validity (kW/m <sup>2</sup> )	h (W/m <sup>2</sup> .K)
Horizontal:	$q_s < 15.8$	$1040 \times (\Delta T_e)^{1/3}$
	$15.8 < q_s < 236$	$5.56 \times (\Delta T_e)^3$
<b>Vertical:</b>	$q_s < 3.15$	$539 \times (\Delta T_e)^{1/7}$
	$3.15 < q_s < 63.1$	$7.95 \times (\Delta T_e)^3$

**Table 11.4:** Simplified relations for boiling heat transfer coeff. for water at one atm. pressure

**Heat transfer coefficients at pressures other than atmospheric** may be calculated using the following empirical equation:

$$h_p = h_a \cdot \left( \frac{p}{p_a} \right)^{0.4} \quad \dots (11.20)$$

where,  $h_p$  = heat transfer coeff. at any pressure  $p$ ,

$h_a$  = heat transfer coeff. at pressure  $p_a$  (= 1 atm.) from Table 11.4.

**Note: All the above relations are for submerged bodies in pool boiling.**

Now, let us consider ‘Flow boiling’, where the fluid is in motion while boiling occurs:

**Flow Boiling:**

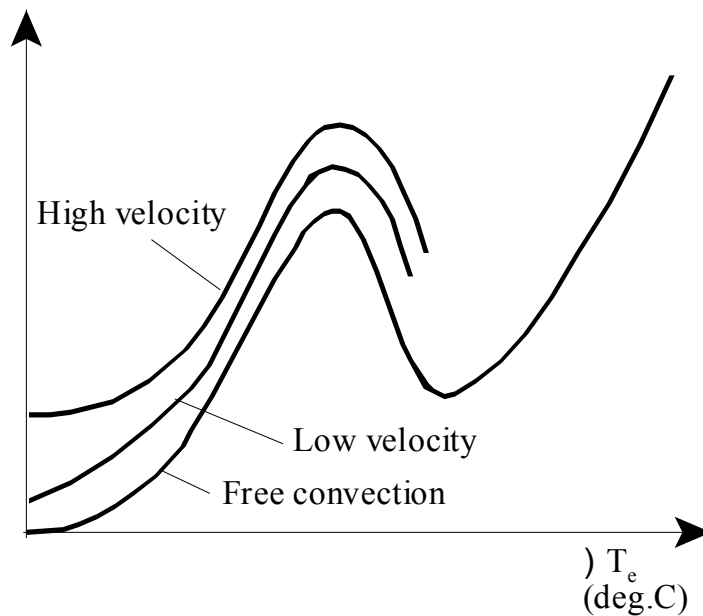

In flow boiling, a fluid is forced to move over a heated surface while the phase change occurs. Therefore, combined effects of natural/forced convection and pool boiling come into play.

Flow boiling is classified as:

- i) External flow boiling, and
- ii) Internal flow boiling

**(i) External flow boiling:**

In external flow boiling, flow occurs over the surface of a plate or cylinder; there are the flow regimes similar to that in pool boiling, but due to the effect of flow velocity, both the nucleate boiling heat flux and the critical heat flux get enhanced. See Fig. 11.5. For water in external flow boiling, critical heat flux value as high as 35 MW/m<sup>2</sup> has been obtained (as compared to the value of 1.3 MW/m<sup>2</sup> in pool boiling at one atm.).

**Fig. 11.5** Effect of flow velocity in external flow boiling

For cross flow over a cylinder of diameter D, Lienhard and Eichhorn have given following correlations for max. (or critical) heat flux, depending upon whether the fluid velocity is 'low' or 'high'.

Criterion to determine if the velocity is low or high is:

$$\frac{q_{\max}}{\rho_V h_{fg} \cdot V} > \left[ \left( \frac{0.275}{\pi} \right) \cdot \left( \frac{\rho_L}{\rho_V} \right)^{\frac{1}{2}} + 1 \right] \dots \text{low velocity}$$

and,

$$\frac{q_{\max}}{\rho V^h_{fg} \cdot V} < \left( \frac{0.275}{\pi} \right) \cdot \left( \frac{\rho L}{\rho V} \right)^{\frac{1}{2}} + 1 \quad \text{.....high velocity}$$

**Correlation for Low velocity:**

$$\frac{q_{\max}}{\rho V^h_{fg} \cdot V} = \frac{1}{\pi} \left[ 1 + \left( \frac{4}{We_D} \right)^{\frac{1}{3}} \right] \quad \text{.....(11.21)}$$

**Correlation for High velocity:**

$$\frac{q_{\max}}{\rho V^h_{fg} \cdot V} = \frac{\left( \frac{\rho L}{\rho V} \right)^{\frac{3}{4}}}{169 \cdot \pi} + \frac{\left( \frac{\rho L}{\rho V} \right)^{\frac{1}{2}}}{19.2 \cdot \pi \cdot We_D^{\frac{1}{3}}} \quad \text{.....(11.22)}$$

**ORACLE®**

**Click on the ad to read more**

Here,  $V$  is the fluid velocity and  $We_D$  is the **Weber number**, defined as the ratio of inertia forces to surface tension forces, i.e.

$$We_D = \frac{\rho V^2 \cdot D}{\sigma} \quad \dots(11.23)$$

**(ii) Internal flow boiling:**

Internal forced convection boiling refers to flow inside a tube. This is more complicated since, now, there is no free surface for the vapour to escape and results in two phase flow inside the tube. There are different flow regimes occurring inside the tube depending upon the ‘quality’ of the fluid. (‘Quality’ is defined as the ratio of mass of vapour to the total mass of fluid at a given location). This is illustrated in Fig. 11.6, which also shows a qualitative graph of variation of heat transfer coeff. with local quality.

(a) Bubble flow    (b) Slug flow    (c) Annular flow    (d) Mist flow

**Fig. 11.6** Flow regimes and heat transfer coefficient in forced convection flow in a vertical tube

Consider a fluid, at a temperature below its boiling point, entering a vertical, heated tube. Progressive vapourization occurs along the length of the tube and the ‘quality’ increases. Upto a short distance from the inlet, heat transfer coeff. for the single phase fluid may be predicted using the Dittus-Boelter equation.

**Bubble – flow regime:** Soon, the bulk temperature reaches the saturation point, and bubbles are formed at the nucleation sites on the wall and are carried into the main stream, as in nucleate boiling. This is known as the ‘bubble flow regime’ (see fig. 11.6(a)) and the heat transfer coeff. increases. **Heat transfer coeff. in this range can be predicted by superimposing the liquid-forced convection and nucleate pool boiling equations.**

**Slug – flow regime:** Further along the distance, vapour fraction increases and individual bubbles agglomerate and slugs of vapour are formed. This regime is known as ‘slug flow regime’. See Fig. 11.6(b). Fluid velocity increases and since the slugs of vapour are compressible, flow oscillations may occur. Mass fraction of vapour in this regime is around 1%, but volume fraction of vapour may be even upto 50%. **In this regime also, heat transfer coeff. may be calculated by superimposing the liquid-forced convection and nucleate pool boiling equations.** Heat transfer coeff. increases because of increased velocity.

**Annular – flow regime:** As the fluid progresses further up the tube, quality increases due to further addition of heat and vapour forms the core and a film of liquid flows on the inner wall surface. Vapour core travels at a higher velocity than the liquid and vapours are formed primarily at the liquid-vapour interface and not at the wall surface. Quality in this flow regime may be upto 25%. See Fig. 11.6(c).

**Transition – flow regime:** Now, as the quality increases, there is a sudden drop in the value of heat transfer coefficient. Heat flux at this point is known as ‘critical heat flux’. This is the point of dryout. This sudden drop happens since the liquid film at the wall is now replaced by a vapour film, which has a poor thermal conductivity. *There may be sharp increase in the wall temperature and even burn-out may occur.*

**Mist – flow regime:** Now, the tube is fully occupied by the vapour, which may contain droplets of liquid. This is known as mist-flow regime. See Fig. 11.6(d). Heat transfer from the wall is to the vapour directly, and then from the vapour, heat is transferred to the droplets of liquid contained in the vapour.

**From the annular-flow regime onwards, prediction of heat transfer coefficient is a little difficult and uncertain due to problems of two phase flow.**

**Two phase flow is beyond the scope of this book.**

---

**Correlations to find out heat transfer coefficient in *nucleate flow boiling* only are presented below:**

**Correlations for nucleate flow boiling:**

Rosenhow and Griffith (1955) have suggested that total heat flux be calculated by adding the nucleate pool boiling flux (from eqn. (11.5)) and the forced convection effect (from Dittus-Boelter eqn. with the coeff. 0.023 replaced by 0.019),

i.e.

$$q_{total} = q_{nucleate} + q_{forced\_convection} \quad \dots(11.24)$$

For forced convection flow **inside vertical tubes**, following correlation is recommended:

$$h = 2.54 \cdot (\Delta T_e)^3 \cdot e^{\frac{p}{1.551}} \quad W/(m^2.K) \dots(11.25)$$

where,  $\Delta T_e = T_s - T_{sat}$ , and p = pressure in mega pascals.

Above eqn. is valid for the pressure range of 5 to 170 bar.

**For horizontal tubes**, McAdams et.al. suggest following relation for low pressure boiling water:

$$q_{total} = q_{conv} + q_{boiling}$$

$q_{conv}$  is calculated using:

$$Nu = 0.019 \cdot Re^{0.8} \cdot Pr^{0.4} \quad \dots \text{Nusselts No.} = (h \cdot D) / k_{liq}$$

$$Re = \frac{G(1-x) \cdot D}{\mu_{liq}} \quad \text{where } x = \text{dryness, } G = \text{mass velocity (kg/m}^2\text{.s)}$$

$$q_{boiling} = 2.253 \cdot \Delta T_e^{3.96} \quad W/m^2 \dots \text{for } 0.2 < P < 0.7 \text{ MPa}$$

$$q_{boiling} = 283.2 \cdot P^{\frac{4}{3}} \cdot \Delta T_e^3 \quad W/m^2 \dots \text{for } 0.7 < P < 4 \text{ MPa}$$

Here, the pressure P is in mega-Pascals.

=====

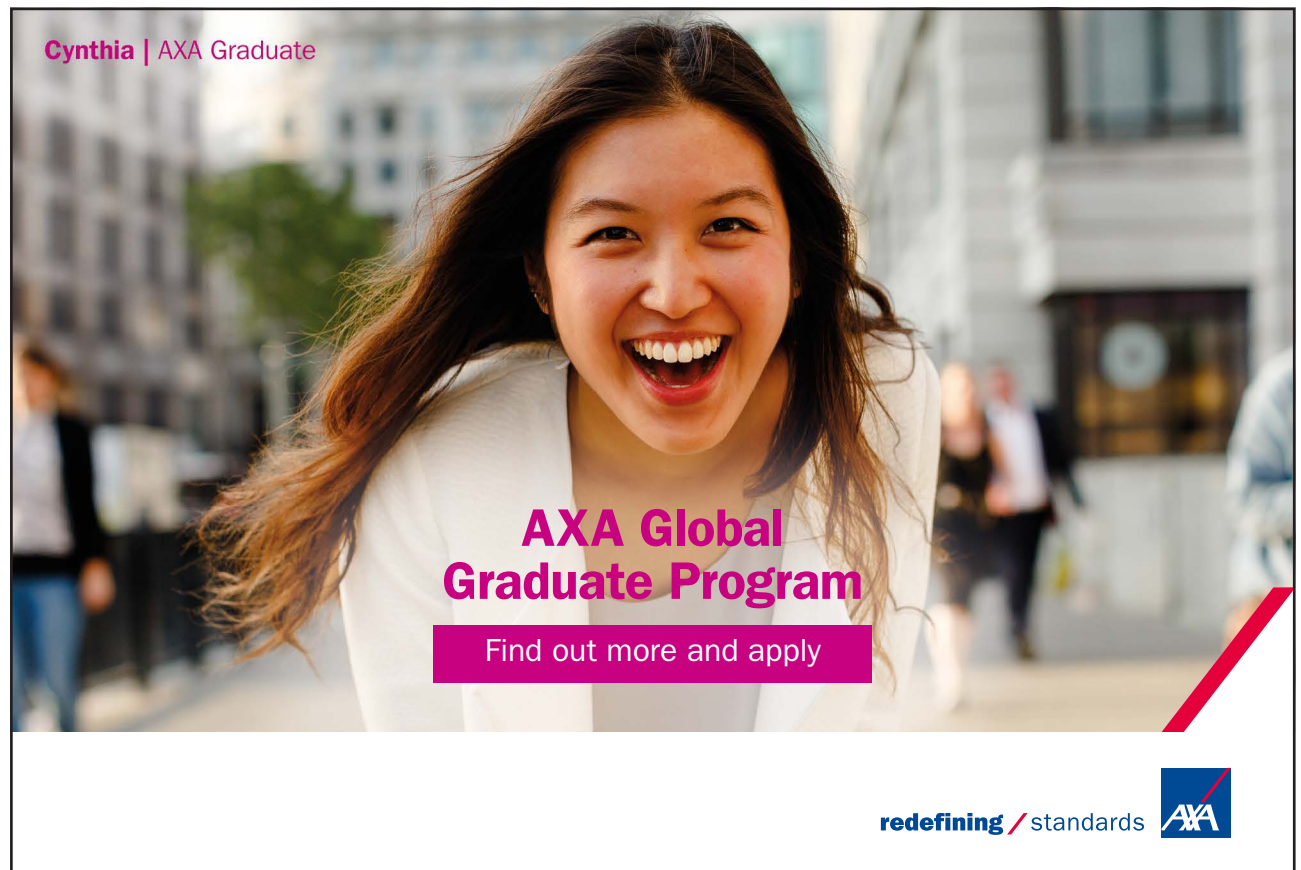

**Prob.3.1.1:** Water at a pressure of one atm. is boiled in a polished copper pan, 300 mm dia. If the surface temperature of the pan is 110 C, (a) calculate the boiling heat flux and the heat transfer coefficient. What is the evaporation rate of water? (b) compare the nucleate boiling flux with the max. heat flux.

**We shall solve this problem with Mathcad.**

Since Mathcad does not have built-in functions for properties of Water, we will have to write them.

Remember that we wrote a few Functions in Mathcad for properties of sat. water earlier (See prob. 2A2.2.4, for example). However, there we wrote Functions only for sat. water, liquid; and, the Functions were written using the curve-fit equations.

Now, for a change, we will use interpolation from Data Tables for Sat. water (Ref: Incropera, Ref. 3) and write Functions for both sat. liquid and sat. vapour.

**Interpolation in Mathcad is very simple:**

The format is:

$Y = \text{linterp}(V_x, V_y, X)$ , where

$V_x$  is the vector of x-values

$V_y$  is the vector of y-values

$X$  is the value of  $X$  at which the y-value is desired

$Y$  is the value of interpolated y value

---

First, properties given in data Table from Incropera (say, from an EXCEL file) are copied to Mathcad as two Matrices  $M1$  and  $M2$  as shown:

Units for various quantities in the following Table are:

**Units:**  $T(K)$ ,  $v_f \cdot 10^3 (m^3/kg)$ ,  $v_g (m^3/kg)$ ,  $h_{fg} (kJ/kg)$ ,  $cp_f(kJ/kg.K)$ ,  $cp_g (kJ/kg.K)$ ,  
 $\mu_f \cdot 10^6 (N.s/m^2)$ ,  $\mu_g \cdot 10^6 (N.s/m^2)$ ,  $k_f \cdot 10^3 (W/m.K)$ ,  $k_g \cdot 10^3 (W/m.K)$ ,  $Pr_f$ ,  
 $\sigma_f \cdot 10^3 (N/m)$ ,  $\beta_f \cdot 10^6 (1/K)$ :

	T (K)	v_f	v_g	h_fg	cp_f	cp_g		mu_f	mu_g	k_f	k_g	Pr_f	sigma_f

580	1.433	0.0193	1353	6	6.4		88	20.4	528	76.7	0.99	12.8	
600	1.541	0.0137	1176	7	8.75		81	22.7	497	92.9	1.14	8.4	
620	1.705	0.0094	941	9.35	15.4		72	25.9	444	114	1.52	4.5	
640	2.075	0.0057	560	26	42		59	32	367	155	4.2	0.8	
645	2.351	0.0045	361	90	1.00·10 <sup>10</sup>		54	37	331	178	12	0.1	
647.3	3.17	0.0032	0	1.00·10 <sup>10</sup>	1.00·10 <sup>10</sup>		45	45	238	238	1.00·10 <sup>10</sup>	0	

Now, each column is extracted as a vector and then the interpolation function 'linterp' is used for linear interpolation.

For example, zeroth column of M1 is Temp in Kelvin. It is extracted as:

$$\text{TempK} := \text{M1}^{\langle 0 \rangle}$$

This means: 0<sup>th</sup> column of M1 is assigned as a vector called TempK. (Note: In Mathcad, by default, the column and row numbers start from 0 and *not* 1).

Similarly, v\_f, the specific volume of liquid, is in the 1<sup>st</sup> column of M1. It is extracted as:

$$\text{H2Ov}_f := \text{M1}^{\langle 1 \rangle}$$

which means that values of sp. vol. of liquid, which are in the 1<sup>st</sup> column of M1 are read as a column vector H2Ov\_f.

**Now, at any given temp T, value of v\_f is obtained by linear interpolation, by writing:**

$$\text{vf} := \text{linterp}(\text{TempK}, \text{H2Ov}_f, T) \cdot 10^{-3}$$

Similarly, we have vectors extracted for other properties:

$$\begin{array}{llll} \text{TempK} := \text{M1}^{\langle 0 \rangle} & \text{H2Ov}_f := \text{M1}^{\langle 1 \rangle} & \text{H2Ov}_g := \text{M1}^{\langle 2 \rangle} & \text{H2Oh}_{fg} := \text{M1}^{\langle 3 \rangle} \\ \text{H2Ocp}_f := \text{M1}^{\langle 4 \rangle} & \text{H2Ocp}_g := \text{M1}^{\langle 5 \rangle} & \text{H2Omu}_f := \text{M2}^{\langle 0 \rangle} & \text{H2Omu}_g := \text{M2}^{\langle 1 \rangle} \\ \text{H2Ok}_f := \text{M2}^{\langle 2 \rangle} & \text{H2Ok}_g := \text{M2}^{\langle 3 \rangle} & \text{H2OPr}_f := \text{M2}^{\langle 4 \rangle} & \text{H2Osigma}_f := \text{M2}^{\langle 5 \rangle} \end{array}$$

---

For the property,  $\beta$  i.e. coeff. of vol. expansivity, values are available in the Table from  $T = 273.15$  K up to  $T = 420$  K. So, we separately extract them as two vectors:

Temp (K)	beta_f * 10 <sup>6</sup> (1/K)
273.15	-68.05
275	-32.74
280	46.04
285	114.1
290	174
295	227.5
300	276.1
305	320.6
310	361.9
315	400.4
320	436.7
325	471.2
330	504
335	535.5
340	566
345	595.4
350	624.2
355	652.3
360	697.9
365	707.1
370	728.7
373.15	750.1
375	761
380	788
400	896
420	1010

And, Mathcad Functions are written for different properties by interpolation, using these vectors, as explained earlier:

**Mathcad Functions for various properties are::**

**T (K) , beta\_f (1/K) .:**

$$\text{beta\_f\_H2O}(\text{TempKelvin}, \text{H2Obeta\_f}, T) := \begin{cases} \text{return "T must be between 273.15 K and 420 K!!"} & \text{if } T < 273.15 \\ \text{return "T must be between 273.15 K and 420 K!!"} & \text{if } T > 420 \\ \text{beta\_f} \leftarrow \text{linterp}(\text{TempKelvin}, \text{H2Obeta\_f}, T) \cdot 10^{-6} & \text{otherwise} \end{cases}$$

Ex:  $\text{beta\_f\_H2O}(\text{TempKelvin}, \text{H2Obeta\_f}, 385) = 8.15 \times 10^{-4}$

**T (K) , v\_f (m^3/kg) .:**

$$\text{vf\_H2O}(\text{TempK}, \text{H2Ov\_f}, T) := \begin{cases} \text{return "T must be between 273.15 K and 647.3 K!!"} & \text{if } T < 273.15 \\ \text{return "T must be between 273.15 K and 647.3 K!!"} & \text{if } T > 647.3 \\ \text{vf} \leftarrow \text{linterp}(\text{TempK}, \text{H2Ov\_f}, T) \cdot 10^{-3} & \text{otherwise} \end{cases}$$

Ex:  $\text{vf\_H2O}(\text{TempK}, \text{H2Ov\_f}, 642) = 2.185 \times 10^{-3}$

### Masters in Management

Designed for high-achieving graduates across all disciplines, London Business School's Masters in Management provides specific and tangible foundations for a successful career in business.

This 12-month, full-time programme is a business qualification with impact. In 2010, our MiM employment rate was 95% within 3 months of graduation\*; the majority of graduates choosing to work in consulting or financial services.

As well as a renowned qualification from a world-class business school, you also gain access to the School's network of more than 34,000 global alumni – a community that offers support and opportunities throughout your career.

For more information visit [www.london.edu/mm](http://www.london.edu/mm), email [mim@london.edu](mailto:mim@london.edu) or give us a call on +44 (0)20 7000 7573.

| return "T must be between 273.15 K and 647.3 K!!" if T < 273.15
| return "T must be between 273.15 K and 647.3 K!!" if T > 647.3
| vg ← linterp(TempK,H2Ov_g,T) otherwise
    
```

---

Ex:  $vg\_H2O(TempK,H2Ov\_g,290) = 69.7$

---

**T (K) , h\_fg (J/kg) .:**

```

h_fg_H2O(TempK,H2Oh_fg,T) :=
| return "T must be between 273.15 K and 647.3 K!!" if T < 273.15
| return "T must be between 273.15 K and 647.3 K!!" if T > 647.3
| h_fg ← linterp(TempK,H2Oh_fg,T)·103 otherwise
    
```

Ex:  $h\_fg\_H2O(TempK,H2Ov\_f,642) = 2.185 \times 10^3$

---

**T (K) , cp\_f (J/kg.K) .:**

```

cp_f_H2O(TempK,H2Ocp_f,T) :=
| return "T must be between 273.15 K and 647.3 K!!" if T < 273.15
| return "T must be between 273.15 K and 647.3 K!!" if T > 647.3
| cp_f ← linterp(TempK,H2Ocp_f,T)·103 otherwise
    
```

Ex:  $cp\_f\_H2O(TempK,H2Ocp\_f,642) = 5.16 \times 10^4$

---

**T (K) , cp\_g (J/kg.K) .:**

```

cp_g_H2O(TempK,H2Ocp_g,T) :=
| return "T must be between 273.15 K and 647.3 K!!" if T < 273.15
| return "T must be between 273.15 K and 647.3 K!!" if T > 647.3
| cp_g ← linterp(TempK,H2Ocp_g,T)·103 otherwise
    
```

Ex:  $cp\_g\_H2O(TempK,H2Ocp\_g,642) = 4 \times 10^{12}$

---

**T (K) , mu\_f (kg/m.s) .:**

```
mu_f_H2O(TempK,H2Omu_f,T) := | return "T must be between 273.15 K and 647.3 K !!!" if T < 273.15
                             | return "T must be between 273.15 K and 647.3 K !!!" if T > 647.3
                             | mu_f ← linterp(TempK,H2Omu_f,T)·10-6 otherwise
```

Ex:  $\mu_{f\_H2O}(\text{TempK}, \text{H2O}\mu_{f}, 642) = 5.7 \times 10^{-5}$

**T (K) , mu\_g (kg/m.s) .:**

```
mu_g_H2O(TempK,H2Omu_g,T) := | return "T must be between 273.15 K and 647.3 K !!!" if T < 273.15
                             | return "T must be between 273.15 K and 647.3 K !!!" if T > 647.3
                             | mu_g ← linterp(TempK,H2Omu_g,T)·10-6 otherwise
```

Ex:  $\mu_{g\_H2O}(\text{TempK}, \text{H2O}\mu_{g}, 642) = 3.4 \times 10^{-5}$

## Get Internationally Connected at the University of Surrey

MA Intercultural Communication with International Business  
MA Communication and International Marketing

### MA Intercultural Communication with International Business

Provides you with a critical understanding of communication in contemporary socio-cultural contexts by combining linguistic, cultural/media studies and international business and will prepare you for a wide range of careers.

### MA Communication and International Marketing

Equips you with a detailed understanding of communication in contemporary international marketing contexts to enable you to address the market needs of the international business environment.

**T (K) , k<sub>f</sub> (W/m.K) .:**

$$k_{f\_H2O}(TempK, H2Ok\_f, T) := \begin{cases} \text{return "T must be between 273.15 K and 647.3 K !!!" if } T < 273.15 \\ \text{return "T must be between 273.15 K and 647.3 K !!!" if } T > 647.3 \\ k_f \leftarrow \text{linterp}(TempK, H2Ok\_f, T) \cdot 10^{-3} \text{ otherwise} \end{cases}$$

Ex:  $k_{f\_H2O}(TempK, H2Ok\_f, 642) = 0.353$

---

**T (K) , k<sub>g</sub> (W/m.K) .:**

$$k_{g\_H2O}(TempK, H2Ok\_g, T) := \begin{cases} \text{return "T must be between 273.15 K and 647.3 K !!!" if } T < 273.15 \\ \text{return "T must be between 273.15 K and 647.3 K !!!" if } T > 647.3 \\ k_g \leftarrow \text{linterp}(TempK, H2Ok\_g, T) \cdot 10^{-3} \text{ otherwise} \end{cases}$$

Ex:  $k_{g\_H2O}(TempK, H2Ok\_g, 642) = 0.164$

---

**T (K) , Pr<sub>f</sub> .:**

$$Pr_{f\_H2O}(TempK, H2OPr\_f, T) := \begin{cases} \text{return "T must be between 273.15 K and 647.3 K !!!" if } T < 273.15 \\ \text{return "T must be between 273.15 K and 647.3 K !!!" if } T > 647.3 \\ Pr_f \leftarrow \text{linterp}(TempK, H2OPr\_f, T) \text{ otherwise} \end{cases}$$

Ex:  $Pr_{f\_H2O}(TempK, H2OPr\_f, 642) = 7.32$

---

**T (K) , sigma<sub>f</sub> (N/m) .:**

$$sigma_{f\_H2O}(TempK, H2Osigma\_f, T) := \begin{cases} \text{return "T must be between 273.15 K and 647.3 K !!!" if } T < 273.15 \\ \text{return "T must be between 273.15 K and 647.3 K !!!" if } T > 647.3 \\ sigma_f \leftarrow \text{linterp}(TempK, H2Osigma\_f, T) \cdot 10^{-3} \text{ otherwise} \end{cases}$$

Ex:  $sigma_{f\_H2O}(TempK, H2Osigma\_f, 642) = 5.2 \times 10^{-4}$

---

We also need properties of Steam (i.e. water vapour) at 1 atm and different temperatures, while solving problems on Film boiling heat transfer.

So, let us write Mathcad Functions for properties of Steam at 1 atm as a function of temperature:

**First, get the properties of Steam at 1 atm from an EXCEL Table (Ref: Incropera, Ref. 3):**

**Properties of Water vap, i.e. Steam at 1 atm. (Ref: Incropera, p. 921):**

**Units:** T(K) , rho (kg/m<sup>3</sup>), cp (kJ/kg.K), mu \*10<sup>7</sup> (Ns/m<sup>2</sup>), nu\*10<sup>6</sup> (m<sup>2</sup>/s), k\*10<sup>3</sup> (W/m.K), alpha\*10<sup>6</sup> (m<sup>2</sup>/s), Pr:

	T	rho	cp	mu	nu	k	alpha	Pr
M5 :=	380	0.5863	2.06	127.1	21.68	24.6	20.4	1.06
	400	0.5542	2.014	134.4	24.25	26.1	23.4	1.04
	450	0.4902	1.98	152.5	31.11	29.9	30.8	1.01
	500	0.4405	1.985	170.4	38.68	33.9	38.8	0.998
	550	0.4005	1.997	188.4	47.04	37.9	47.4	0.993
	600	0.3652	2.026	206.7	56.6	42.2	57	0.993
	650	0.338	2.056	224.7	66.48	46.4	66.8	0.996
	700	0.314	2.085	242.6	77.26	50.5	77.1	1
	750	0.2931	2.119	260.4	88.84	54.9	88.4	1
	800	0.2739	2.152	278.6	101.7	59.2	100	1.01
850	0.2579	2.186	296.9	115.1	63.7	113	1.02	

Then, extract the different columns as vectors:

$$\begin{aligned}
 \text{TKelvin} &:= \text{M5}^{\langle 0 \rangle} & \text{Steam\_rho} &:= \text{M5}^{\langle 1 \rangle} & \text{Steam\_cp} &:= \text{M5}^{\langle 2 \rangle} & \text{Steam\_mu} &:= \text{M5}^{\langle 3 \rangle} \\
 \text{Steam\_nu} &:= \text{M5}^{\langle 4 \rangle} & \text{Steam\_k} &:= \text{M5}^{\langle 5 \rangle} & \text{Steam\_alpha} &:= \text{M5}^{\langle 6 \rangle} & \text{Steam\_Pr} &:= \text{M5}^{\langle 7 \rangle}
 \end{aligned}$$

**And, now write the Mathcad Functions to get different properties (i.e. rho, cp, mu and k) of Steam as functions of Temp by linear interpolation in Mathcad:**

**T (K) , rho\_steam (kg/m<sup>3</sup>):.**

$$\text{rho\_steam}(\text{TKelvin}, \text{Steam\_rho}, T) := \begin{cases} \text{return "T must be between 380 K and 850 K !!!" if } T < 380 \\ \text{return "T must be between 380 K and 850 K !!!" if } T > 850 \\ \text{rho} \leftarrow \text{linterp}(\text{TKelvin}, \text{Steam\_rho}, T) \text{ otherwise} \end{cases}$$

Ex: rho\_steam(TKelvin, Steam\_rho, 498) = 0.442

**T (K) , cp\_steam (J/kg.K):**

```
cp_steam(TKelvin, Steam_cp, T) :=  $\left\{ \begin{array}{l} \text{return "T must be between 380 K and 850 K !!!" if } T < 380 \\ \text{return "T must be between 380 K and 850 K !!!" if } T > 850 \\ \text{cp} \leftarrow \text{interp}(\text{TKelvin}, \text{Steam\_cp}, T) \cdot 10^3 \text{ otherwise} \end{array} \right.$ 
```

Ex:  $\text{cp\_steam}(\text{TKelvin}, \text{Steam\_cp}, 498) = 1.985 \times 10^3$

---

**T (K) , mu\_steam (N.s/m^2):**

```
mu_steam(TKelvin, Steam_mu, T) :=  $\left\{ \begin{array}{l} \text{return "T must be between 380 K and 850 K !!!" if } T < 380 \\ \text{return "T must be between 380 K and 850 K !!!" if } T > 850 \\ \text{mu} \leftarrow \text{interp}(\text{TKelvin}, \text{Steam\_mu}, T) \cdot 10^{-7} \text{ otherwise} \end{array} \right.$ 
```

Ex:  $\text{mu\_steam}(\text{TKelvin}, \text{Steam\_mu}, 498) = 1.697 \times 10^{-5}$

---

 Click on the ad to read more

**T (K) , k\_steam (W/m.K):**

```
k_steam(TKelvin, Steam_k, T) :=
| return "T must be between 380 K and 850 K!!" if T < 380
| return "T must be between 380 K and 850 K!!" if T > 850
| k ← linterp(TKelvin, Steam_k, T) · 10-3 otherwise
```

Ex: k\_steam(TKelvin, Steam\_k, 498) = 0.0337

---

Now, while solving problems on Boiling, we need to solve for Nucleate boiling flux, max. (or, Critical) heat flux for horizontal or cylindrical surfaces, min. heat flux, film boiling heat transfer coefficients for horizontal or cylindrical surfaces etc.

Since these equations are rather complicated, we shall write Mathcad Functions for them using the property Functions written above, so that it will be very convenient to solve problems, as illustrated below.

Now, let us solve the above problem.

It is stated again:

**Prob.3.1.1:** Water at a pressure of one atm. is boiled in a polished copper pan, 300 mm dia. If the surface temperature of the pan is 110 C, (a) calculate the boiling heat flux and the heat transfer coefficient. What is the evaporation rate of water? (b) compare the nucleate boiling flux with the max. heat flux.

**Mathcad Solution:**

**Since  $\Delta T_e < 30$  C, it is Nucleate boiling regime.**

Let us write a Function for Nucleate boiling heat flux: (Remember that it is valid for all geometries)

**Mathcad Function to find  $q_{\text{nucleate}}$  for Water boiling at 1 atm:**

**Input:**  $T_s$  (C),  $T_{\text{sat}}$  (C),  $C_{\text{sf}}$  --from Table for Surface-fluid combination

**Output:**  $q_{\text{nucleate}}$  (W/m<sup>2</sup>)

```
NucleateBoiling_Water_q_nucleate(Ts, Tsat, Csf) :=
return "Use Film boiling correlations since (Ts - Tsat) > 30 C!" if (Ts - Tsat) > 30
rhoL ←  $\frac{1}{v_{f\_H2O}(TempK, H2Ov\_f, T_{sat} + 273.15)}$ 
rhoV ←  $\frac{1}{v_{g\_H2O}(TempK, H2Ov\_g, T_{sat} + 273.15)}$ 
cpL ← cpf\_H2O(TempK, H2Ocpf, Tsat + 273.15)
muL ← muf\_H2O(TempK, H2Omuf, Tsat + 273.15)
PrL ← Prf\_H2O(TempK, H2OPrf, Tsat + 273.15)
hfg ← hfg\_H2O(TempK, H2Ohfg, Tsat + 273.15)
sigma ← sigmaf\_H2O(TempK, H2Osigmaf, Tsat + 273.15)
n ← 1
g ← 9.81
A ← muL · hfg
B ←  $\left[ \frac{g \cdot (\rho_L - \rho_V)}{\sigma} \right]^{\frac{1}{2}}$ 
C ←  $\left[ \frac{cp_L \cdot (T_s - T_{sat})^3}{C_{sf} \cdot h_{fg} \cdot Pr_L^n} \right]$ 
qnucleate ← A · B · C
```

And, for max. heat flux for a Flat surface we write the Mathcad Function as:

**Mathcad Function to find  $q_{\text{max}}$  (or, crit. heat flux) for Water, for a flat surface:**

**Input:**  $T_{\text{sat}}$  (C)

**Output:**  $q_{\text{max}}$  (W/m<sup>2</sup>)

```
NucleateBoiling_Water_FlatSurface_q_max(Tsat) :=
rhoL ←  $\frac{1}{v_{f\_H2O}(TempK, H2Ov\_f, T_{sat} + 273.15)}$ 
rhoV ←  $\frac{1}{v_{g\_H2O}(TempK, H2Ov\_g, T_{sat} + 273.15)}$ 
muL ← muf\_H2O(TempK, H2Omuf, Tsat + 273.15)
hfg ← hfg\_H2O(TempK, H2Ohfg, Tsat + 273.15)
sigma ← sigmaf\_H2O(TempK, H2Osigmaf, Tsat + 273.15)
g ← 9.81
A ← 0.149 · hfg · rhoV
B ←  $\left[ \frac{g \cdot \sigma \cdot (\rho_L - \rho_V)}{\rho_V^2} \right]^{\frac{1}{4}}$ 
qmax ← A · B
```

And, for Min. heat flux, the Mathcad Function is:

**Mathcad Function to find  $q_{min}$  (or, min.. heat flux) for Water, for a horizl. surface:**

Input:  $T_{sat}$  (C)

Output:  $q_{min}$  (W/m<sup>2</sup>)

---

```

NucleateBoiling_Water_HorizPlate_q_min(T_sat) :=
rho_L ←  $\frac{1}{vf\_H2O(TempK, H2Ov\_f, T_{sat} + 273.15)}$ 
rho_V ←  $\frac{1}{vg\_H2O(TempK, H2Ov\_g, T_{sat} + 273.15)}$ 
h_fg ← h_fg_H2O(TempK, H2Oh_fg, T_sat + 273.15)
sigma ← sigma_f_H2O(TempK, H2Osigma_f, T_sat + 273.15)
g ← 9.81
A ← 0.09 · rho_V · h_fg
B ← sigma · g · (rho_L - rho_V)
C ← (rho_L + rho_V)2
q_min ← A ·  $\left(\frac{B}{C}\right)^{\frac{1}{4}}$ 
q_min
    
```

---

As a leading technology company in the field of geophysical science, PGS can offer exciting opportunities in offshore seismic exploration.

We are looking for new BSc, MSc and PhD graduates with Geoscience, engineering and other numerate backgrounds to join us.

Click on the ad to read more

Now, we shall use these Functions to solve the above problem:

**Data:**

$$T_s := 110 \quad \text{C...temp. of surface}$$

$$T_{\text{sat}} := 100 \quad \text{C...sat. temp. of water at 1 atm.}$$

$$d := 0.3 \quad \text{m....dia of pan}$$

$$C_{\text{sf}} := 0.013 \quad \text{...for water - polished copper combination}$$

$$h_{\text{fg}} := h_{\text{fg\_H2O}}(\text{TempK}, \text{H2O}h_{\text{fg}}, T_{\text{sat}} + 273.15) \quad \text{J/kg ... applying the Mathcad Function for } h_{\text{fg}}$$

$$\text{i.e. } h_{\text{fg}} = 2.257 \times 10^6 \quad \text{J/kg}$$

Since  $\Delta T$  is 10 deg.C, it is reasonable to assume that correlation for nucleate boiling regime is applicable. Then:

**We have the Mathcad Function for q in nucleate boiling:**

Applying the same:

$$q_{\text{nucleate}} := \text{NucleateBoiling\_Water\_q\_nucleate}(T_s, T_{\text{sat}}, C_{\text{sf}})$$

$$\text{i.e. } q_{\text{nucleate}} = 1.369 \times 10^5 \quad \text{W/m}^2 \text{.....Ans.}$$

**Heat transfer coeff.:**

$$\text{We have: } h := \frac{q_{\text{nucleate}}}{(T_s - T_{\text{sat}})} \quad \text{W/(m}^2 \cdot \text{C)}$$

$$\text{i.e. } h = 1.369 \times 10^4 \quad \text{W/(m}^2 \cdot \text{C)....Ans.}$$

**Evaporation rate:**

$$\text{Total amount of heat supplied: } Q := q_{\text{nucleate}} \cdot \left( \frac{\pi \cdot d^2}{4} \right) \quad \text{W}$$

$$\text{i.e. } Q = 9.678 \times 10^3 \quad \text{W}$$

$$\text{Therefore, evap. rate of water: } m := \frac{Q}{h_{\text{fg}}} \quad \text{kg/s}$$

$$\text{i.e. } m = 4.288 \times 10^{-3} \quad \text{kg/s}$$

$$\text{i.e. } m = 15.742 \quad \text{kg/h....Ans.}$$

**(b) Max. heat flux:**

We have, from from the Mathcad Function for Max. heat flux,  $q_{max}$ :

$$q_{max} := \text{NucleateBoiling\_Water\_FlatSurface\_q\_max}(T_{sat}) \quad \text{W/m}^2 \dots$$

i.e.  $q_{max} = 1.259 \times 10^6 \quad \text{W/m}^2 \dots \text{Ans.}$

Thus, actual heat flux ( $q_{nucleate}$ ) is much smaller than the critical (max) heat flux.

**(c) Min. heat flux:**

We have, from from the Mathcad Function for Min. heat flux,  $q_{min}$ :

$$q_{min} := \text{NucleateBoiling\_Water\_HorizlPlate\_q\_min}(T_{sat}) \quad \text{W/m}^2 \dots$$

i.e.  $q_{min} = 1.895 \times 10^4 \quad \text{W/m}^2 \dots \text{Ans.}$

Thus, we see that having Mathcad Functions made these calculations very easy.

=====

**Prob.3.1.2:** Water at a pressure of one atm. is boiled in a mechanically polished stainless steel pan, 30 cm dia. If the heater is of 1.8 kW rating, assuming that all the heat supplied is transferred to the pan, determine the temp of inner surface of the pan. What will be evaporation rate of water?

**Mathcad Solution:**

**Note:** In Nucleate boiling regime, max. temp difference,  $\Delta T_e$  is about 30 deg. C.

So, we will assume  $\Delta T_e = 20 \text{ C}$  and, for polished S.S. take the value of  $C_{sf} = 0.013$  from Table, and find  $q_s$ . Then, apply Solve Block of Mathcad to get correct value of  $T_s$  such that  $Q = 1.8 \text{ kW}$ :

**Data:**

$T_{sat} := 100$  C...sat. temp. of water at 1 atm.

$d := 0.3$  m....dia of pan

$C_{sf} := 0.013$  ...for water - polished SS combination

$h_{fg} := h_{fg\_H2O}(TempK, H2Oh\_fg, T_{sat} + 273.15)$  J/kg ... applying the Mathcad Function for  $h_{fg}$

i.e.  $h_{fg} = 2.257 \times 10^6$  J/kg

$Q_{heater} := 1.8 \cdot 10^3$  W.... by data

Now, first find the heat flux,  $q_s$ :

$$q_s := \frac{Q}{\left(\frac{\pi \cdot d^2}{4}\right)} \quad \text{i.e.} \quad q_s = 1.369 \times 10^5 \quad \text{W/m}^2$$

In Nucleate boiling regime, we have:

$$q_s = \text{NucleateBoiling\_Water\_q\_nucleate}(T_s, T_{\text{sat}}, C_{\text{sf}}) \quad \dots \text{using the Function for nucleate boiling flux}$$

Here,  $q_s$  is known, and  $T_s$  is the unknown.  
So, apply 'Solve Block' construct of Mathcad to find  $T_s$ :

**Start with the assumed value of  $T_s$ :**

$$T_s := 120 \quad \text{C..temp. of surface... assumed, will be found out later.}$$

Given

$$q_s = \text{NucleateBoiling\_Water\_q\_nucleate}(T_s, T_{\text{sat}}, C_{\text{sf}})$$

$$T_s := \text{Find}(T_s)$$

$$T_s = 110 \quad \text{C .... temp of inner surface of pan .... Ans.}$$

**Evaporation rate:**

$$\text{Total amount of heat supplied:} \quad Q := 1800 \quad \text{W}$$

$$\text{Therefore, evap. rate of water:} \quad m := \frac{Q}{h_{\text{fg}}} \quad \text{kg/s}$$

$$\text{i.e.} \quad m = 7.975 \times 10^{-4} \quad \text{kg/s}$$

$$\text{i.e.} \quad m = 2.871 \quad \text{kg/h....Ans.}$$

**Prob.3.1.3:** A 65 cm long, 2 cm dia brass heater is used to boil water at 120 C. Surface temp of heater is not allowed to exceed 125 C. Determine the rate of steam production in the boiler in kg/h.

**Mathcad Solution:**

**Note:** In Nucleate boiling regime, max. temp difference,  $\Delta T_e$  is about 30 deg. C.

Here, we have,  $\Delta T_e = 5$  C (i.e.  $< 30$  C); **So, it is nucleate boiling regime.**

And, for water-brass combination, take the value of  $C_{sf} = 0.006$  from Table, and find  $q_s$ .

**Data:**

$T_s := 125$  C.... surface temp of heater

$T_{sat} := 120$  C...sat. temp. of water.

$d := 0.02$  m....dia of heater

$C_{sf} := 0.006$  ...for water - brass combination

$h_{fg} := h_{fg\_H2O}(TempK, H2O, h_{fg}, T_{sat} + 273.15)$  J/kg ... applying the Mathcad Function for  $h_{fg}$

i.e.  $h_{fg} = 2.202 \times 10^6$  J/kg

In Nucleate boiling regime, we have:

$q_s := \text{NucleateBoiling\_Water\_q\_nucleate}(T_s, T_{sat}, C_{sf})$  ...using the Function for nucleate boiling flux

Therefore,

$q_s = 2.951 \times 10^5$  W/m<sup>2</sup>.....Ans.

and, Heat supplied,  $Q = A * q_s$ :

i.e.  $Q := (\pi \cdot 0.02 \cdot 0.65) \cdot q_s$

i.e.  $Q = 1.205 \times 10^4$  W

Therefore, evaporation rate:

$$m := \frac{Q}{h_{fg}}$$

i.e.  $m = 5.474 \times 10^{-3}$  kg/s

i.e.  $m \cdot 3600 = 19.705$  kg/h .... Ans.

=====

**Prob.3.1.4:** A 20 mm dia, 0.75 m long copper tube is used to boil saturated water at 1 atm. Find the tube surface temp if heat flux is limited to 75 % of critical heat flux.

(b) Also, plot the surface temp. as function of heat flux for  $0.25 < (q_s / q_{max}) < 0.90$ .

**Mathcad Solution:**

**Note:** In Nucleate boiling regime, max. temp difference,  $\Delta T_e$  is about 30 deg. C.

Here, we assume that it is nucleate boiling regime.

And, for water-copper combination, take the value of  $C_{sf} = 0.013$  from Table.

Here, we need  $q_{max}$  for a horizontal cylinder.

**Remember that max. heat flux depend on geometry of surface.**

Now, we shall write a Function for max. flux for a horizl. Cylinder:

**Mathcad Function to find  $q_{max}$  (or, crit. heat flux) for Water boiling for a horizl cylinder:**

**Input:**  $T_{sat}$  (C), Radius, R(m)

**Output:**  $q_{max}$  (W/m<sup>2</sup>)

$$\text{NucleateBoiling\_Water\_HorizlCylinder\_}q_{max}(T_{sat}, R) := \begin{cases} \rho_{HL} \leftarrow \frac{1}{v_{f\_H2O}(TempK, H2Ov\_f, T_{sat} + 273.15)} \\ \rho_{HV} \leftarrow \frac{1}{v_{g\_H2O}(TempK, H2Ov\_g, T_{sat} + 273.15)} \\ \mu_L \leftarrow \mu_{f\_H2O}(TempK, H2O\mu\_f, T_{sat} + 273.15) \\ h_{fg} \leftarrow h_{fg\_H2O}(TempK, H2Oh\_fg, T_{sat} + 273.15) \\ \sigma \leftarrow \sigma_{f\_H2O}(TempK, H2O\sigma\_f, T_{sat} + 273.15) \\ g \leftarrow 9.81 \\ q_{max\_F} \leftarrow 0.131 \cdot h_{fg} \cdot \sqrt{\rho_{HV} \cdot [\sigma \cdot g \cdot (\rho_{HL} - \rho_{HV})]}^{\frac{1}{4}} \\ R\_prime \leftarrow R \cdot \left[ \frac{g \cdot (\rho_{HL} - \rho_{HV})}{\sigma} \right]^{\frac{1}{2}} \\ q_{max} \leftarrow q_{max\_F} \cdot 0.894 \quad \text{if } R\_prime > 3.47 \\ q_{max} \leftarrow q_{max\_F} \cdot (0.89 + 2.27 \cdot \exp(-3.44 \cdot \sqrt{R\_prime})) \quad \text{if } 0.15 < R\_prime < 3.47 \\ q_{max} \end{cases}$$

Observe that much calculation effort is required to do this calculation.

However, having a Mathcad Function to do this, makes it simple to solve not only this problem, but all other similar problems.

**Data:**

$$T_s := 105 \quad \text{C.... surface temp of heater. .... assumed}$$

$$T_{\text{sat}} := 100 \quad \text{C...sat. temp. of water at 1 atm.}$$

$$R := 0.01 \quad \text{m....radius of copper tube}$$

$$C_{\text{sf}} := 0.013 \quad \text{...for water - copper combination}$$

**For critical (or, max.) heat flux,** we have, the Mathcad Function already written::

$$q_{\text{max}} := \text{NucleateBoiling\_Water\_HorizlCylinder\_q\_max}(T_{\text{sat}}, R) \quad \text{...using the Function for nucleate boiling flux}$$

Therefore,

$$q_{\text{max}} = 9.893 \times 10^5 \quad \text{W/m}^2 \text{.....Ans.}$$

For Nucleate boiling, by data,  $q_s$  is 0.75 times  $q_{\text{max}}$ :

$$q_s := 0.75 \cdot q_{\text{max}} \quad \text{i.e.} \quad q_s = 7.42 \times 10^5 \quad \text{W/m}^2 \text{....Nucleate boiling flux}$$

Now, use the Mathcad Function for Nucleate boiling heat flux and apply the Solve block to find surface temp,  $T_s$ .

**Start with an assumed value of  $T_s$ :**

$$T_s := 105 \quad \text{C.... surface temp of heater. .... assumed}$$

Given

$$q_s = \text{NucleateBoiling\_Water\_q\_nucleate}(T_s, T_{\text{sat}}, C_{\text{sf}})$$

$$T_s(q_s) := \text{Find}(T_s)$$

$$T_s(q_s) = 117.564 \quad \text{C..... Surface temp...Ans.}$$

**Note:** We have written  $T_s$  as a function of  $q_s$  so that it will be easier to calculate values of  $T_s$  for different values of  $q_s$  (and plot the graph), by using the same Solve block.

**To plot  $T_s$  for various values of  $(q_s/q_{max})$ :**

Use the solution of Solve Box obtained above, by entering  $q_s$  as a vector.

Note the use of ‘vectorize operator’ to get values of  $T_s$  for various values of  $q_{s,max}$ :

Here, first define Fraction as a vector, from 0.25 to 0.9, as required by the problem.

And, then, immediately,  $q_s$  is calculated as a vector:

```

Fraction := (0.25 0.3 0.35 0.4 0.45 0.5 0.55 0.6 0.65 0.7 0.75 0.8 0.85 0.9) ...Fraction
                                                    = qs/qmax

qs := qmax * Fraction    ...values of qs
    
```

Now,  $T_s$  as a function of  $q_s$  is easily calculated using the Solve block set up above. Note the use of vectorize operator (i.e. a horizontal arrow above  $T_s$ ):

$T_s(q_{s,max} \cdot \text{Fraction})$	0	1	2	3	4	5	6	7	8
	112.179	112.942	113.624	114.244	114.814	115.344	115.839	116.305	116.746

## Technical training on *WHAT* you need, *WHEN* you need it

**At IDC Technologies we can tailor our technical and engineering training workshops to suit your needs. We have extensive experience in training technical and engineering staff and have trained people in organisations such as General Motors, Shell, Siemens, BHP and Honeywell to name a few.**

Our onsite training is cost effective, convenient and completely customisable to the technical and engineering areas you want covered. Our workshops are all comprehensive hands-on learning experiences with ample time given to practical sessions and demonstrations. We communicate well to ensure that workshop content and timing match the knowledge, skills, and abilities of the participants.

We run onsite training all year round and hold the workshops on your premises or a venue of your choice for your convenience.

**For a no obligation proposal, contact us today at [training@idc-online.com](mailto:training@idc-online.com) or visit our website for more information: [www.idc-online.com/onsite/](http://www.idc-online.com/onsite/)**

Get the results neatly in columns (useful for plotting):

**Results:**

Fraction of $q_{max}$		Values of $q_s$ (W)		Values of $T_s$ (C)	
	0		0		0
	0.25		$2.473 \cdot 10^5$		112.179
	0.3		$2.968 \cdot 10^5$		112.942
	0.35		$3.462 \cdot 10^5$		113.624
	0.4		$3.957 \cdot 10^5$		114.244
	0.45		$4.452 \cdot 10^5$		114.814
	0.5		$4.946 \cdot 10^5$		115.344
Fraction $T =$	6 0.55	$q_s T =$	6 $5.441 \cdot 10^5$	$(T_s(q_{max} \cdot \text{Fraction})) T =$	6 115.839
	7 0.6		7 $5.936 \cdot 10^5$		7 116.305
	8 0.65		8 $6.43 \cdot 10^5$		8 116.746
	9 0.7		9 $6.925 \cdot 10^5$		9 117.165
	10 0.75		10 $7.42 \cdot 10^5$		10 117.564
	11 0.8		11 $7.914 \cdot 10^5$		11 117.946
	12 0.85		12 $8.409 \cdot 10^5$		12 118.313
	13 0.9		13 $8.904 \cdot 10^5$		13 118.665

And, plot  $T_s$  against Fraction, in Mathcad:

**Prob.3.1.5:** A nickel wire, 1 mm dia. and 300 mm long, is submerged in a water bath open to atmosphere.

What is the value of current flowing through the wire that will cause burnout, if the applied voltage is 10 V?

**Mathcad Solution:**

**Data:**

$T_{sat} := 100$  C...sat. temp. of water at 1 atm.

$R := 0.0005$  m....radius of wire

$L := 0.3$  m....length of wire

$V := 10$  V....applied voltage

This is the case of a horizontal cylinder.

So, let us use the Mathcad Function, already written, for max. (or, critical) heat flux for a horizontal cylinder.

$q_{max} := \text{NucleateBoiling\_Water\_HorizlCylinder\_q\_max}(T_{sat}, R)$

i.e.  $q_{max} = 1.525 \times 10^6$  W/m<sup>2</sup>....This is the value of 'Burn-out' flux

If V is the voltage, and, I the current through the wire, we have:

$$q_{max} = \frac{V \cdot I}{2 \cdot \pi \cdot R \cdot L}$$

i.e.  $I := \frac{q_{max} \cdot 2 \cdot \pi \cdot R \cdot L}{V}$  A.....current through the wire

i.e.  $I = 143.723$  A.....current through the wire...Ans.

=====

**Prob.3.1.6:** A horizontal, metal-clad heating element, 10 mm dia, and of surface emissivity 0.85, is submerged in a water bath. Surface temperature of the heating element is 300 C. If the water is at atmospheric pressure, calculate the power dissipation per unit length of the heater.

**Mathcad Solution:**

Because of high surface temp, we know that  $\Delta T_e$  will be  $> 30$  C, and it will be **Film boiling regime**.

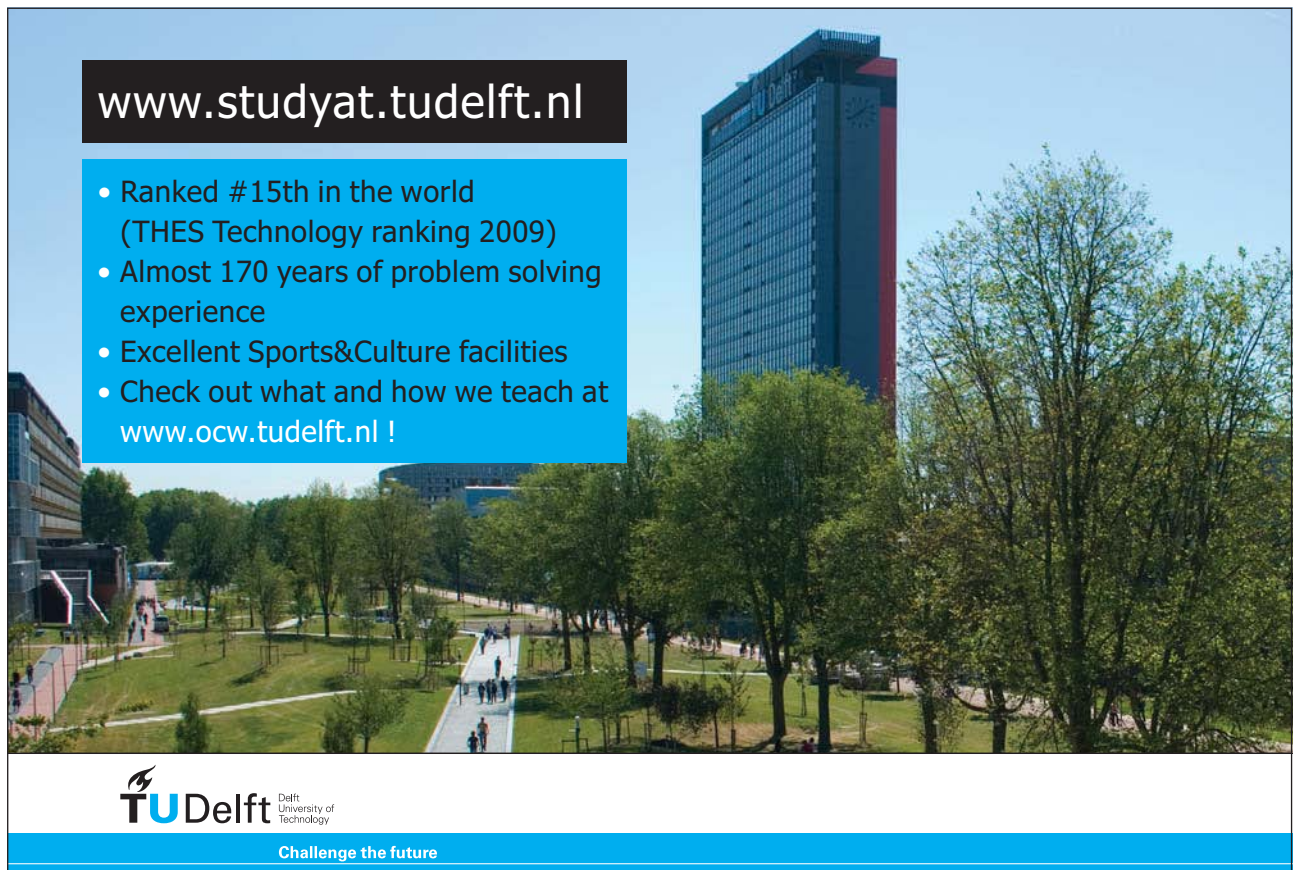

In Film boiling regime for a horizontal cylinder, we will write a Mathcad Function to calculate heat transfer coefficient,  $h_{\text{film}}$ :

**Mathcad Function to find  $h_{\text{film}}$  for Film boiling for Water boiling at 1 atm, for a horizl. cylinder:**

**Input:**  $T_s$ ,  $T_{\text{sat}}$  (C), dia D (m)

**Output:**  $h_{\text{film}}$  ( $\text{W}/\text{m}^2\cdot\text{C}$ )

**Note:** Take vapour properties at  $T_f$ , at 1 atm

**TU Delft** Delft University of Technology  
Challenge the future

```

FilmBoiling_Water_HorizlCylinder_h_film(Ts,Tsat,D) :=
return "Use Nucleate boiling correlations since (Ts - Tsat) < 30 C! " if (Ts - Tsat) < 30
Tf ← (Ts + Tsat) / 2
rhoL ← 1 / (vf_H2O(TempK,H2Ovf,Tsat + 273.15))
rhoV ← rho_steam(TKelvin,Steam_rho,Tf + 273.15)
hfg ← h_fg_H2O(TempK,H2Oh_fg,Tsat + 273.15)
muV ← mu_steam(TKelvin,Steam_mu,Tf + 273.15)
kV ← k_steam(TKelvin,Steam_k,Tf + 273.15)
cpV ← cp_steam(TKelvin,Steam_cp,Tf + 273.15)
sigma ← sigma_f_H2O(TempK,H2Osigma_f,Tsat + 273.15)
hfg_prime ← hfg + 0.4·cpV·(Ts - Tsat)
g ← 9.81
C0 ← 0.62
B ← g·rhoV·(rhoL - rhoV)·hfg_prime·kV3
C ← muV·(Ts - Tsat)·D
hfilm ← C0·(B/C)1/4
hfilm
    
```

Now, let us solve the problem:

**Data:**

- T<sub>sat</sub> := 100 C...sat. temp. of water at 1 atm.
- D := 0.01 m....dia. of wire
- L := 1 m....length of wire, assumed
- T<sub>s</sub> := 300 C....surface temp.
- e := 0.85 ...emissivity of surface
- σ := 5.67·10<sup>-8</sup> W/(m<sup>2</sup>.K<sup>4</sup>)...Stefan-Boltzmann const.

Since the excess temp. is (300 – 100) = 200 C, it is **film boiling region**.

We will use the Mathcad Function already written for Film boiling on a cylinder:

$$h_{film} := \text{FilmBoiling\_Water\_HorizlCylinder\_h\_film}(T_s, T_{sat}, D)$$

i.e. **h<sub>film</sub> = 198.709 W/m<sup>2</sup>.C ..... film boiling heat transfer coeff.**

**Note:** In film boiling, since surface temp is generally high, we have to include the effect of radiation too:

**Radiative heat transfer coeff. is given by:**

$$h_{\text{rad}} := \frac{\sigma \cdot \varepsilon \cdot \left[ (T_s + 273)^4 - (T_{\text{sat}} + 273)^4 \right]}{(T_s - T_{\text{sat}})} \quad \text{W/(m}^2\cdot\text{C).....}$$

i.e.  $h_{\text{rad}} = 21.313 \quad \text{W/(m}^2\cdot\text{C)}$

**Note:** Use absolute temperatures in eqn. for radiative heat transfer

**Therefore, the 'total' heat transfer coeff. is given by:**

$$h := h_{\text{film}} + 0.75 \cdot h_{\text{rad}} \quad \text{..W/m}^2\cdot\text{C}$$

i.e.  $h = 214.693 \quad \text{W/(m}^2\cdot\text{C)}$

**Therefore, power dissipation per unit length of heater:**

$$Q := h \cdot (\pi \cdot D \cdot L) \cdot (T_s - T_{\text{sat}}) \quad \text{W/m}$$

i.e.  $Q = 1.349 \times 10^3 \quad \text{W/m.....Ans.}$

=====

**Prob.3.1.7:** A large, horizontal plate is kept immersed in a water bath boiling at 1 atm, 100 C. Surface temperature of the plate is 260 C. Calculate the heat transfer coeff. and the heat flux. Assume the emissivity of the surface as 0.9.

**Mathcad Solution:**

Because of high surface temp, we know that  $\Delta T_e$  will be  $> 30$  C, and it will be **Film boiling regime**.

**In Film boiling regime for a horizontal plate,** we will write a Mathcad Function to calculate heat transfer coefficient,  $h_{\text{film}}$ :

**Mathcad Function to find  $h_{\text{film}}$  for Film boiling for Water boiling, for a horizl. surface:**

**Input:**  $T_s, T_{\text{sat}}$  (C)

**Output:**  $h_{\text{film}}$  (W/m<sup>2</sup>.C)

**Note:** Take vapour properties at  $T_f$ , at 1 atm

```

FilmBoiling_Water_HorizlPlate_h_film(Ts, T_sat) :=
return "Use Nucleate boiling correlations since (Ts - T_sat) < 30 C!" if (Ts - T_sat) < 30
Tf ← (Ts + T_sat) / 2
rhoL ← 1 / (vf_H2O(TempK, H2Ov_f, T_sat + 273.15))
rhoV ← rho_steam(TKelvin, Steam_rho, Tf + 273.15)
hfg ← h_fg_H2O(TempK, H2O_h_fg, T_sat + 273.15)
muV ← mu_steam(TKelvin, Steam_mu, Tf + 273.15)
kV ← k_steam(TKelvin, Steam_k, Tf + 273.15)
cpV ← cp_steam(TKelvin, Steam_cp, Tf + 273.15)
sigma ← sigma_f_H2O(TempK, H2Osigma_f, T_sat + 273.15)
hfg_prime ← hfg + 0.4 * cpV * (Ts - T_sat)
g ← 9.81
C0 ← 0.59
B ← g * rhoV * (rhoL - rhoV) * hfg_prime * kV^3
C ← muV * (Ts - T_sat) * 2 * pi * [sigma / (g * (rhoL - rhoV))]^(1/2)
h_film ← C0 * (B / C)^(1/4)
h_film

```

Now, solve the above problem:

**Data:**

$T_{sat} := 100$     C...sat. temp. of water at 1 atm.

$T_s := 260$     C....surface temp.

$\epsilon := 0.9$     ...emissivity of surface

Since the excess temp. is  $(260 - 100) = 160$  C, it is **film boiling region**.

We will use the Mathcad Function already written for heat transfer coeff in film boiling for a flat surface in water:

$$h_{film} := \text{FilmBoiling\_Water\_HorizlPlate\_h\_film}(T_s, T_{sat})$$

i.e.  $h_{film} = 174.934$      $\text{W/m}^2\text{.C}$  ..... film boiling heat transfer coeff.

And, Radiative heat transfer coeff.:

$\sigma := 5.67 \cdot 10^{-8} \text{ W}/(\text{m}^2 \cdot \text{K}^4)$ ...Stefan-Boltzmann const.

$$h_{\text{rad}} := \frac{\sigma \cdot \epsilon \cdot \left[ (T_s + 273)^4 - (T_{\text{sat}} + 273)^4 \right]}{(T_s - T_{\text{sat}})} \quad \text{W}/(\text{m}^2 \cdot \text{C}) \dots$$

i.e.  $h_{\text{rad}} = 19.567 \text{ W}/(\text{m}^2 \cdot \text{C})$

**Note:** Use absolute temperatures in eqn. for radiative heat transfer

Therefore, the 'total' heat transfer coeff. is given by:

$$h := h_{\text{film}} + 0.75 \cdot h_{\text{rad}} \quad \dots(11.17)$$

i.e.  $h = 189.609 \text{ W}/(\text{m}^2 \cdot \text{C}) \dots \text{Ans.}$

"I studied English for 16 years but...  
...I finally learned to speak it in just six lessons"  
Jane, Chinese architect

ENGLISH OUT THERE

Click to hear me talking before and after my unique course download

And, the heat flux:

$$q := h \cdot (T_s - T_{sat}) \quad \text{W/m}^2$$

i.e.  $q = 3.034 \times 10^4 \quad \text{W/m}^2 \dots \text{Ans.}$

**EES Procedures / Functions for Boiling heat transfer calculations:**

EES has a great advantage that it has built-in functions for properties of a large number of fluids including Water/steam.

So, it is very easy to write Functions or Procedures for various boiling heat transfer calculations.

**First, let us write Functions for Nucleate boiling heat flux, critical (or Max.) heat flux for a horizontal surface, for a horizontal cylinder, and for a Sphere:**

\$UnitSystem SI Pa C J

“EES Procedures for Boiling calculations:”

“Nucleate Boiling of Water – heat flux: valid for any geometry:”

FUNCTION NucleateBoiling\_flux\_water(T\_sat, T\_s, C\_sf)

“Nucleate boiling of water – heat flux (W/m<sup>2</sup>):”

“Note: C\_sf is the surface-fluid combination factor-from Handbook”

```

g:= 9.81[m/s^2]
rho_l:=Density(Steam_IAPWS,T=T_sat, x=0) “[kg/m^3]”
rho_v:=Density(Steam_IAPWS,T=T_sat, x=1) “[kg/m^3]”
k_l:=Conductivity(Steam_IAPWS,T=T_sat, x = 0) “[W/m-C]”
mu_l:=Viscosity(Steam_IAPWS,T=T_sat,x=0) “[kg/m-s]”
h_g:=Enthalpy(Steam_IAPWS,T=T_sat,x=1) “[J/kg]”
h_f:=Enthalpy(Steam_IAPWS,T=T_sat,x=0) “[J/kg]”
h_fg:= h_g - h_f “[J/kg]”
Pr_l:=Prandtl(Steam_IAPWS,T=T_sat,x=0)
sigma:=SurfaceTension(Steam_IAPWS,T=T_sat) “[N/m]”
cp_l:=SpecHeat(Steam_IAPWS,T=T_sat,x=0) “[J/kg-C]”
    
```

```
NucleateBoiling_flux_water:= mu_l * h_fg * (g * (rho_l - rho_v)/sigma)^(1/2) * (cp_l * (T_s - T_sat)/
(C_sf * h_fg * Pr_l))^3
```

END

“ .....

“Nucleate Boiling of Water – Critical heat flux: depends on geometry:”

“For large, horizontal surface:”

```
FUNCTION Water_horizl_surface_q_max(T_sat)
```

“Nucleate boiling of water – critical heat flux (W/m<sup>2</sup>):”

```
g:= 9.81[m/s^2]
```

```

```

```
EndIf
```

```
END
```

“-----”

**Now, let us write Functions in EES for Film boiling heat transfer coeff./heat flux:**

“Film Boiling of Water – heat flux: depends on geometry:”

“For horizontal cylinder:”

```
FUNCTION Water_horizl_cylinder_q_film (T_sat, T_s, D)
```

“Film boiling of water – heat flux ( $\text{W}/\text{m}^2$ ):”

```

**Now, let us solve some problems in EES using these Functions/Procedures:**

**Prob.3.1.8:** Water at a pressure of one atm. is boiled in a polished copper pan, 150 mm dia. If the surface temperature of the pan is 115 C, (a) calculate the boiling heat flux and the heat transfer coefficient. What is the evaporation rate of water? (b) compare the nucleate boiling flux with the max. (or critical) heat flux.

(c) what pan temp is required to achieve the critical heat flux?

**EES Solution:**

“Data:”

$\text{T}_s = 115$  [C]

$\text{T}_{sat} = 100$  [C]

$\text{D} = 0.15$  [m]

$\text{C}_{sf} = 0.013$  “...for water – polished copper combination”

“Let us use the EES Functions/Procedures written above:”

“Nucleate boiling heat flux:”

$\text{q}_s = \text{NucleateBoiling\_flux\_water}(\text{T}_{sat}, \text{T}_s, \text{C}_{sf})$

$$h_{\text{nucleate}} = q_s / (T_s - T_{\text{sat}}) \text{ "[W/m}^2\text{-C]"}'$$

$$Q = q_s * (\pi * D^2 / 4) \text{ "[W] .... Total heat tr to pan}"'$$

$$h_{\text{liq}} = \text{Enthalpy(Steam\_IAPWS,T=T}_{\text{sat}},x=0) \text{ "[J/kg]"}'$$

$$h_{\text{vap}} = \text{Enthalpy(Steam\_IAPWS,T=T}_{\text{sat}},x=1) \text{ "[J/kg]"}'$$

$$h_{\text{fg}} = h_{\text{vap}} - h_{\text{liq}} \text{ "[J/kg]"}'$$

"Evaporation rate:"

$$m_{\text{evap}} = (Q / h_{\text{fg}}) * 3600 \text{ "[kg/s]"}'$$

"Max. or critical heat flux:"

"Using the EES Function written above:"

$$q_{\text{max}} = \text{Water\_horizl\_surface\_q\_max}(T_{\text{sat}}) \text{ "[W/m}^2\text{]"}'$$

"What is the pan temp when critical heat flux is reached?"

"Put  $q_s = q_{\text{max}}$  in the relation for Nucleate boiling flux:"

$q_{\text{max}} = \text{NucleateBoiling\_flux\_water}(T_{\text{sat}}, T_{\text{max}}, C_{\text{sf}})$  "...determines  $T_{\text{max}}$  when  $q_{\text{max}}$  is reached"

**Results:**

$h_{\text{fg}} = 2.256\text{E}+06 \text{ [J/kg]}$	$h_g = 2.676\text{E}+06 \text{ [J/kg]}$
$k_l = 0.6791 \text{ [W/m-C]}$	$\mu_l = 0.0002817 \text{ [kg/m-s]}$
$\text{NucleateBoiling}_{\text{flux,water}} = 254431 \text{ [W/m}^2\text{]}$	$Pr_f = 1.749$
$\rho_l = 958.3 \text{ [kg/m}^3\text{]}$	$\rho_v = 0.5981 \text{ [kg/m}^3\text{]}$
$\sigma = 0.05891 \text{ [N/m]}$	$T_s = 112.2 \text{ [C]}$
$T_{\text{sat}} = 100 \text{ [C]}$	

**Thus:**

**Surface temp.  $T_s = 112.2 \text{ C} \dots \text{Ans.}$**

=====

“**Prob.3.1.13:** A metal clad heating element of 10 mm dia and of emissivity 0.9 is submerged in a water bath horizontally. If the surface temp is 300 C, calculate the power dissipation per unit length of the heater. Water is at atm. pressure.”

**EES Solution:**

**“Data:”**

$$T_s = 300 \text{ [C]}$$

$$T_{\text{sat}} = 100 \text{ [C]}$$

$$D = 0.01 \text{ [m]}$$

$$\text{epsilon} = 0.9$$

$$\text{sigma} = 5.67\text{E-}08 \text{ [W/m}^2\text{-K}^4\text{]} \text{ “...Stefan-Boltzmann const.”}$$

“Use the EES Function for  $q_{\text{film}}$  , film boiling flux, written above, for a horizl cylinder:”

$$q_{\text{film}} = \text{Water\_horizl\_cylinder\_q\_film} (T_{\text{sat}}, T_s, D) \text{ “[W/m}^2\text{]....film boiling flux”}$$

**“Therefore:”**

$$h_{\text{film}} = q_{\text{film}} / (T_s - T_{\text{sat}}) \text{ “[W/m}^2\text{-C].... conv. heat transfer coeff.”}$$

In the past four years we have drilled

# 81,000 km

That's more than **twice** around the world.

**Who are we?**  
We are the world's leading oilfield services company. Working globally—often in remote and challenging locations—we invent, design, engineer, manufacture, apply, and maintain technology to help customers find and produce oil and gas safely.

**Who are we looking for?**  
We offer countless opportunities in the following domains:

- Engineering, Research, and Operations
- Geoscience and Petrotechnical
- Commercial and Business

If you are a self-motivated graduate looking for a dynamic career, apply to join our team.

**What will you be?**

**Schlumberger**

careers.slb.com

$h_{rad} = \sigma * \epsilon * ((T_s + 273)^4 - (T_{sat} + 273)^4) / (T_s - T_{sat})$  “[W/m<sup>2</sup>-C]...radn. heat tr. coeff.”

“Total h:”

$h_{tot} = h_{film} + 0.75 * h_{rad}$  “[W/m<sup>2</sup>-C]...total heat tr. coeff.”

“Therefore:

Power dissip. per unit length of heater:”

$Q = h_{tot} * (\pi * D * 1) * (T_s - T_{sat})$  “[W/m]”

**Results:**

Hellmann's is one of Unilever's oldest brands having been popular for over 100 years. If you too share a passion for discovery and innovation we will give you the tools and opportunities to provide you with a challenging career. Are you a great scientist who would like to be at the forefront of scientific innovations and developments? Then you will enjoy a career within Unilever Research & Development. For challenging job opportunities, please visit [www.unilever.com/rdjobs](http://www.unilever.com/rdjobs).

Could it be  Unilever

Now, to plot Q vs  $T_s$ : Produce 3 parametric Tables, each for  $D = 0.0015$  m,  $0.002$  m, and  $0.0025$  m:

For  $D = 0.0015$  m:

Table 1-D = 0.002 m	Table 2-D = 0.0015 m		Table 3-D = 0.0025 m	
1.9	1 $T_s$ [C]	2 $h_{film}$ [W/m <sup>2</sup> -C]	3 $h_{rad}$ [W/m <sup>2</sup> -C]	4 Q [W/m]
Run 1	250	345.3	10.48	249.6
Run 2	300	330.3	12.54	320.1
Run 3	350	321.2	14.89	391.5
Run 4	400	315.5	17.56	464.7
Run 5	450	312.1	20.56	540.2
Run 6	500	310.2	23.93	618.5
Run 7	550	309.3	27.68	700
Run 8	600	309.3	31.84	784.9
Run 9	650	309.8	36.41	873.7

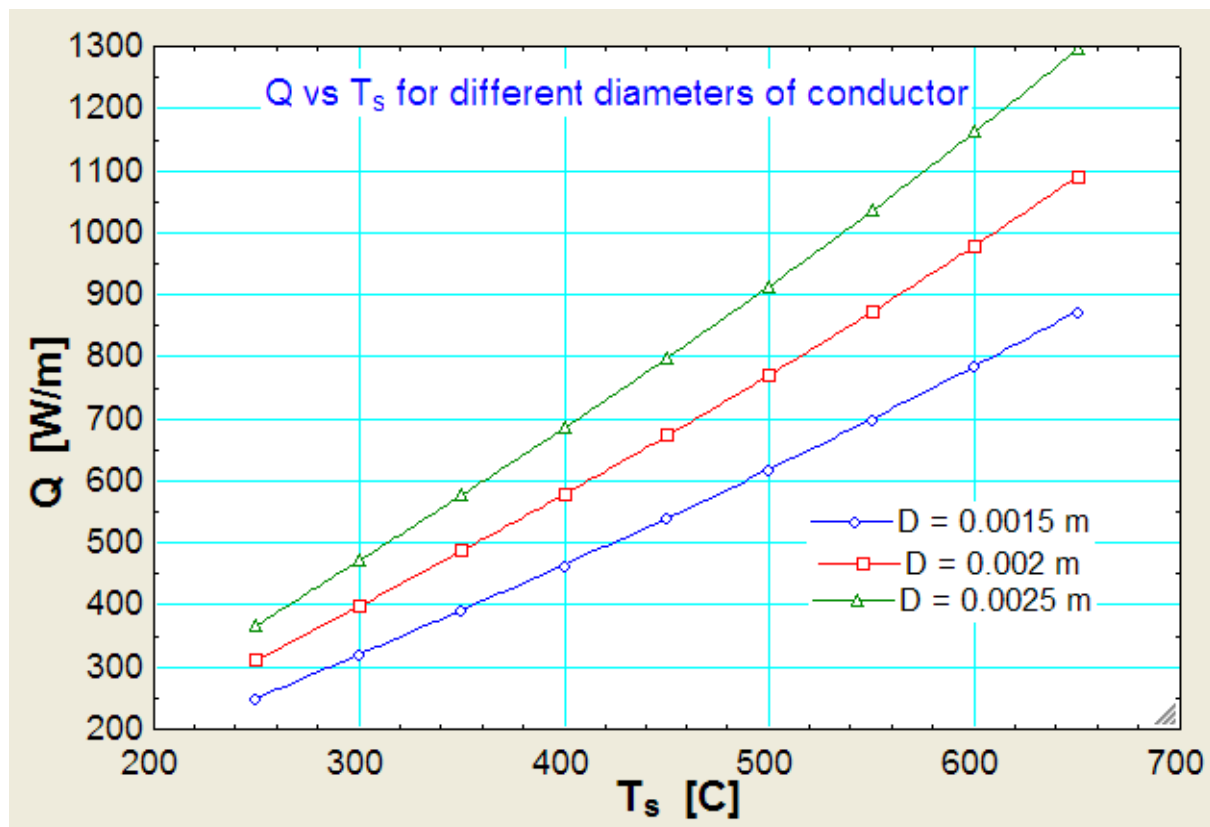

For  $D = 0.002$  m:

Table 1-D = 0.002 m	Table 2-D = 0.0015 m		Table 3-D = 0.0025 m	
1.9	1 $T_s$ [C]	2 $h_{film}$ [W/m <sup>2</sup> -C]	3 $h_{rad}$ [W/m <sup>2</sup> -C]	4 Q [W/m]
Run 1	250	321.4	10.48	310.3
Run 2	300	307.4	12.54	398.1
Run 3	350	298.9	14.89	487
Run 4	400	293.6	17.56	578.3
Run 5	450	290.4	20.56	672.6
Run 6	500	288.7	23.93	770.6
Run 7	550	287.9	27.68	872.6
Run 8	600	287.8	31.84	979.2
Run 9	650	288.3	36.41	1091

For  $D = 0.0025$  m:

	Table 1-D = 0.002 m	Table 2-D = 0.0015 m	Table 3-D = 0.0025 m	
1.9	1	2	3	4
	$T_s$ [C]	$h_{film}$ [W/m <sup>2</sup> -C]	$h_{rad}$ [W/m <sup>2</sup> -C]	Q [W/m]
Run 1	250	303.9	10.48	367.3
Run 2	300	290.7	12.54	471.4
Run 3	350	282.7	14.89	576.9
Run 4	400	277.7	17.56	685.3
Run 5	450	274.7	20.56	797.5
Run 6	500	273	23.93	914
Run 7	550	272.2	27.68	1036
Run 8	600	272.2	31.84	1163
Run 9	650	272.6	36.41	1296

Now, plot them on the same graph:

**Prob.3.1.15:** A 20 mm dia, 0.75 m long copper tube is used to boil saturated water at 1 atm. Find the tube surface temp if heat flux is limited to 75% of critical heat flux.

(b) Also, plot the surface temp. as function of heat flux for  $0.25 < (q_s / q_{\max}) < 0.90$ .

**Note:** This problem is the same as Prob.3.1.4, which was solved with Mathcad.

But, now, we will solve it with EXCEL:

**EXCEL Solution:**

Following are the steps in EXCEL solution:

1. Set up the EXCEL worksheet, enter data and name the cells:

Since the heat flux,  $q_s$  is less than  $q_{\max}$  (or,  $q_{\text{crit}}$ ) by data, the boiling regime is Nucleate boiling (i.e.  $\Delta T_e \leq 30$  C).

Discover the truth at [www.deloitte.ca/careers](http://www.deloitte.ca/careers)

**Deloitte.**

© Deloitte & Touche LLP and affiliated entities.

Click on the ad to read more

So, to start with, we will assume a value for  $T_s$  and later find the correct value of  $T_s$  by applying Goal Seek in EXCEL.

g		fx		9.81	
	A	B	C	D	E
209					
210		<b>Data:</b>	<b>Fluid =</b>	<b>Water</b>	
211		Surface temp...assumed	T_s	120	C
212		Sat. temp.	T_sat	100.0	C
213			n	1.0	For Water
214		Radius of cyl.	Rad	0.0100	m
215		Water-brass combination	C_sf	0.013	
216		accn. Due to gravity	g	9.810	m/s^2

2. We need properties of Sat. water. We use the VBA Functions already written for properties of Sat. water:

sigma_L		fx		=SatH2O_sigmaf_T((T_sat+273.15))	
	A	B	C	D	E
217		<b>Calculations:</b>			
218		density_liq	rho_L	957.8544061	kg/m^3
219		density_vap	rho_V	0.5956	kg/m^3
220		dyn. Visc_liq	mu_L	0.000279	N.s/m^2
221		th. conductivity_liq	k_L	0.68	W/m.C
222		th. conductivity_vap	k_V	0.0248	W/m.C
223		sp.heat_liq	cp_L	4217	J/kg.K
224		sp.heat_vap	cp_V	2029	J/kg.K
225		Heat of vaporization	h_fg	2257000	J/kg
226		Prandtl No._liq	Pr_L	1.76	
227		Surface tension	sigma_L	0.0589	N/m

3. Now, first, calculate the Max. or critical heat flux,  $q_{max}$ , for a horizontal cylinder, as shown below. The formulas used are also shown, for clarity:

q_max		fx		=IF(R_prime>3.74,CC,DD)	
	A	B	C	D	E
228					
229					$R_{prime} = Rad \cdot \left[ \frac{g \cdot (\rho_L - \rho_V)}{\sigma_L} \right]^{0.5}$
230					
231		<b>To calculate <math>q_{max}</math> (Max. or Critical heat flux) for horiz cyl:</b>			
232		AA	228179.9637		$AA = 0.131 \cdot h_{fg} \cdot \sqrt{\rho_V}$
233		BB	4.849572083		$BB = [\sigma_L \cdot g \cdot (\rho_L - \rho_V)]^{\frac{1}{4}}$
234		q_max_F	1106575.182		
235		R_prime	3.9929		$CC = q_{max\_F} \cdot 0.894$
236		CC	989278.2124		$DD = (0.89 + 2.27 \cdot \exp(-3.44 \cdot \sqrt{R_{prime}})) \cdot q_{max\_F}$
237		DD	9.87450E+05		
238		q_max	9.89278E+05		W/m^2

Remember  $q_{max}$  depends only on  $T_{sat}$  and the geometry.

4. Now, continue the calculations for Nucleate boiling on the horizontal cylinder:

	A	B	C	D	E	F	G
239							
240		<b>For Nucleate boiling:</b>			$C_1 = \mu \cdot L \cdot h \cdot f_e$	$C_2 = \left[ \frac{g \cdot (\rho_L - \rho_V)}{\sigma \cdot L} \right]^{0.5}$	
241			C_1	629.703	}	$C_3 = \left[ \frac{cp_L \cdot (T_s - T_{sat})}{C_{sf} \cdot h_{fg} \cdot Pr_L^n} \right]^3$	
242			C_2	399.2928588			
243			C_3	4.356503351			
244		Nucleate boiling flux	q_nucleate	1095381.389211	W/m^2 ... Ans.	$q_{nucleate} = C_1 \cdot C_2 \cdot C_3$	
245		(q_nucleate/q_max) =	Fraction	0.7500			
246		q_nucleate	q_s	741958.6593	W/m^2	$q_s = \text{Fraction} \cdot q_{max}$	
247		Diff =	(q_nucleate-q_s)	353422.7299	W/m^2		

In the above, in cell D244, we have the Nucleate boiling flux, as per the equations provided.

The, in cell D246, we have q\_s (i.e. Nucleate boiling flux) as a Fraction of Q\_max.

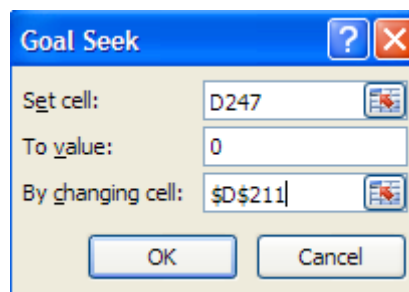

We equate them and find the required value of T\_s to meet this condition i.e. cell D247 contains the difference between cells D244 and D246, and in Goal Seek operation we set it equal to zero to get correct value of T\_s (i.e. cell D211).

5. Following is the Goal Seek operation:

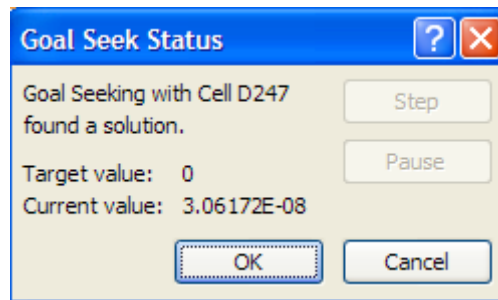

Go to Data – WhatIf Analysis – GoalSeek:

Click on Goal Seek. You get the following screen. Fill it up as shown:

Click OK. We get:

Goal Seek has found a solution. Click OK, and see the value of T<sub>s</sub> in cell D211 as 117.564 C.

Also, observe that all related calculations are immediately updated:

T <sub>s</sub>		fx		117.564459051131	
	A	B	C	D	E
211		Surface temp...assumed	T <sub>s</sub>	117.5644591	C
212		Sat. temp.	T <sub>sat</sub>	100.0	C
213			n	1.0	For Water
214		Radius of cyl.	Rad	0.0100	m
215		Water-brass combination	C <sub>sf</sub>	0.013	
216		accn. Due to gravity	g	9.810	m/s <sup>2</sup>
217		Calculations:			
218		density_liq	rho_L	957.8544061	kg/m <sup>3</sup>
219		density_vap	rho_V	0.5956	kg/m <sup>3</sup>
220		dyn. Visc_liq	mu_L	0.000279	N.s/m <sup>2</sup>
221		th. conductivity_liq	k_L	0.68	W/m.C
222		th. conductivity_vap	k_V	0.0248	W/m.C
223		sp.heat_liq	cp_L	4217	J/kg.K
224		sp.heat_vap	cp_V	2029	J/kg.K
225		Heat of vaporization	h <sub>fg</sub>	2257000	J/kg
226		Prandtl No._liq	Pr_L	1.76	
227		Surface tension	sigma_L	0.0589	N/m
228					

And:

D247		fx		-q_nucleate-q_s	
	A	B	C	D	E
238			q <sub>max</sub>	9.89278E+05	W/m <sup>2</sup>
239					
240		For Nucleate boiling:			
241			C <sub>1</sub>	629.703	$C_1 = \mu_L \cdot h \cdot f_e$
242			C <sub>2</sub>	399.2928588	$C_2 = \left[ \frac{g \cdot (\rho_L - \rho_V)}{\sigma_L} \right]^{-0.5}$
243			C <sub>3</sub>	2.950885/99	$C_3 = \left[ \frac{cp_L \cdot (T_s - T_{sat})}{C_{sf} \cdot h_{fg} \cdot Pr_L^n} \right]^3$
244		Nucleate boiling flux	q <sub>nucleate</sub>	741958.659311	W/m <sup>2</sup> ... Ans.
245		(q <sub>nucleate</sub> /q <sub>max</sub> ) =	Fraction	0.7500	q <sub>nucleate</sub> = C <sub>1</sub> · C <sub>2</sub> · C <sub>3</sub>
246		q <sub>nucleate</sub>	q <sub>s</sub>	741958.6593	q <sub>s</sub> = Fraction · q <sub>max</sub>
247		Diff =	(q <sub>nucleate</sub> - q <sub>s</sub> )	3.06172E-08	W/m <sup>2</sup>

Thus: Tube surface temp when q<sub>s</sub> is 75% of q<sub>max</sub> is: T<sub>s</sub> = 117.564 C ... Ans.

To plot the surface temp. as function of heat flux for  $0.25 < (q_s / q_{max}) < 0.90$ :

6. First, set up a Table containing the values of Fraction, as shown:

D258		fx 0.25	
C	D	E	F
253			
254			
255	Plot T <sub>s</sub> (deg.C) against Fraction (=q <sub>nucleate</sub> /q <sub>max</sub> ) :		
256			
257	Fraction	q <sub>nucleate</sub> (W/m <sup>2</sup> )	T <sub>s</sub> (deg.C)
258	0.25		
259	0.3		
260	0.35		
261	0.4		
262	0.45		
263	0.5		
264	0.55		
265	0.6		
266	0.65		
267	0.7		
268	0.75		
269	0.8		
270	0.85		
271	0.9		
272	0.95		

# Grant Thornton—<sup>REALLY</sup> a great place to work.

We're proud to have been recognized as one of Canada's Best Workplaces by the Great Place to Work Institute™ for the last four years. In 2011 Grant Thornton LLP was ranked as the fifth Best Workplace in Canada, for companies with more than 1,000 employees. We are also very proud to be recognized as one of Canada's top 25 Best Workplaces for Women and as one of Canada's Top Campus Employers.

Priyanka Sawant  
Manager

Audit • Tax • Advisory

Now, we shall write a small VBA program to read these values of Fraction, one at a time, and copy to cell D245. Then immediately cell D246 (= Fraction \* q\_max) will change and the the difference, Diff in cell D247 will also change. Now, apply Goal Seek to make cell D247 zero by changing cell D211 (i.e. value of T\_s). When this is done, all other related values will get immediately updated. Now, copy the values of q\_Nucleate and T\_s to their respective places in the Table.

And this program should be executed with a Command Button:

Let us write the VBA program to do the above jobs:

First, to set up the Command Button:

Go to Developer – Insert – ActiveX controls:

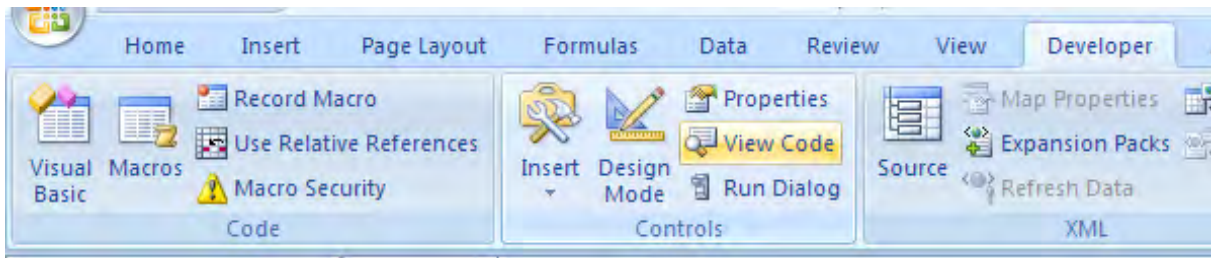

Click on first top left button. And, draw the Command Button in the worksheet to the required size, at the required place:

	C	D	E	F	G	H	I
256

261		0.4					
262		0.45					
263		0.5					
264		0.55					
265		0.6					
266		0.65					
267		0.7					
268		0.75					
269		0.8					
270		0.85					
271		0.9					
272		0.95					

CommandButton1

Click on Developer-View Code:

And, we get the code already written for the Command button:

```
CommandButton1 Click
Private Sub CommandButton1_Click()
|
End Sub
```

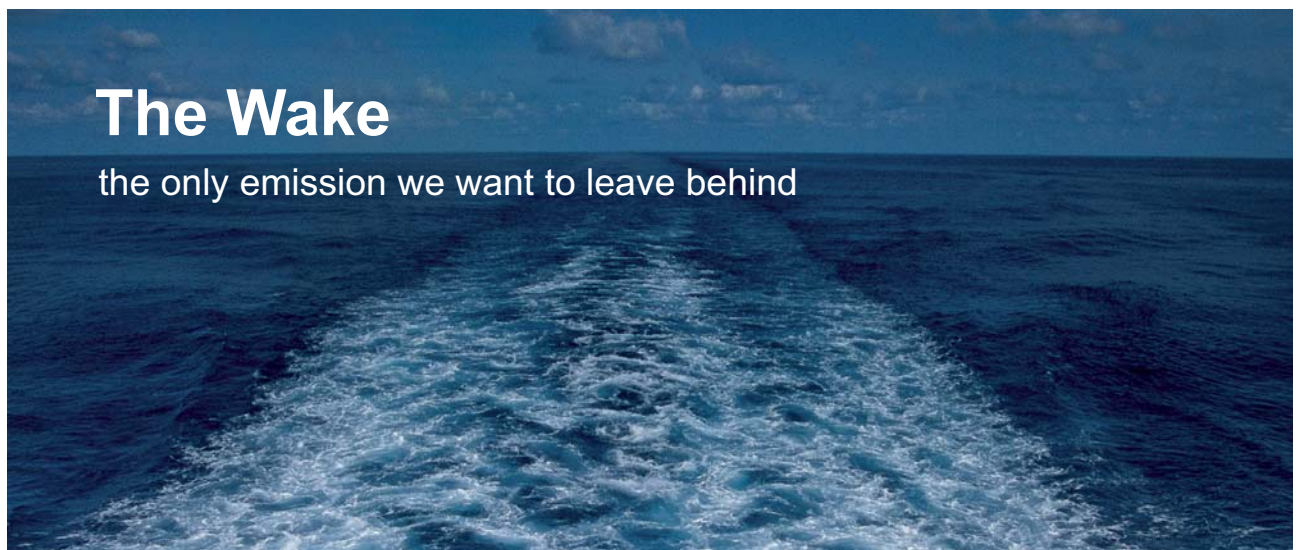

Now, complete the code to do the desired jobs as mentioned under point 4 above:

```
CommandButton1 Click
Private Sub CommandButton1_Click()
Dim i As Integer
For i = 0 To 14
Range("D245") = Cells(258 + i, 4)
Range("D247").GoalSeek Goal:=0, ChangingCell:=Range("D211")
Cells(258 + i, 5) = Range("D244")
Cells(258 + i, 6) = Range("D211")
Next i
End Sub
```

7. Now, click on the Command Button to execute the program. The Table gets filled up immediately:

	C	D	E	F	G	H	I
256							
257		<b>Fraction</b>	<b>q_nucleate(W/m^2)</b>	<b>T_s(deg.C)</b>			
258		0.25	247319.553	112.179			
259		0.3	296783.464	112.942

8. And, plot the graph of  $T_s$  vs Fraction in EXCEL:

Compare these results with those obtained with Mathcad:

Fraction of $q_{max}$		Values of $T_s$ (C)	
	0		0
0	0.25	0	112.179
1	0.3	1	112.942
2	0.35	2	113.624
3	0.4	3	114.244
4	0.45	4	114.814
5	0.5	5	115.344
6	0.55	6	115.839
7	0.6	7	116.305
8	0.65	8	116.746
9	0.7	9	117.165
10	0.75	10	117.564
11	0.8	11	117.946
12	0.85	12	118.313
13	0.9	13	118.665

$\text{Fraction}^T = \left( T_s(q_{max} \text{ Fraction}) \right)^T =$

We find that the results match very well.

=====

**Prob.3.1.16:** A 1 mm dia wire, 150 mm long, is submerged horizontally in water at atm pressure. A steady state voltage of 10 V is applied, and the current flowing is 52.5 A. Find the surface temp of the wire.

**EXCEL Solution:**

It is convenient to make calculations if we have **VBA Functions for Boiling heat transfer calculations.**

So, let us write a few VBA Functions for Nucleate Boiling flux, Max. flux, Film boiling heat transfer coeff. etc.

But, for Film boiling calculations, we need the vapour properties of superheated water vapour (i.e. steam) at different temps and (mostly) at 1 atm.

# CAREER KICKSTART

An app to keep you in the know

Whether you're a graduate, school leaver or student, it's a difficult time to start your career. So here at RBS, we're providing a helping hand with our new Facebook app. Bringing together the most relevant and useful careers information, we've created a one-stop shop designed to help you get on the career ladder – whatever your level of education, degree subject or work experience.

And it's not just finance-focused either. That's because it's not about us. It's about you. So download the app and you'll get everything you need to know to kickstart your career.

So what are you waiting for?

Click [here](#) to get started.

So, first, we use the properties of steam at 1 atm given in Incropera (Ref: 3) and write VBA Functions for properties of Steam:

	L	M	N	O	P	Q	R	S
143	<b>Properties of Steam (Ref: Incropera, p.921)</b>							
144								
145	<b>T (K)</b>	<b>rho (kg/m<sup>3</sup>)</b>	<b>cp (kJ/kg.K)</b>	<b>mu*10<sup>7</sup> (N.s/m<sup>2</sup>)</b>	<b>nu*10<sup>6</sup> (m<sup>2</sup>/s)</b>	<b>k*10<sup>3</sup> (W/m.K)</b>	<b>alpha*10<sup>6</sup> (m<sup>2</sup>/s)</b>	<b>Pr</b>
146	380	0.5863	2.06	127.1	21.68	24.6	20.4	1.06
147	400	0.5542	2.014	134.4	24.25	26.1	23.4	1.04
148	450	0.4902	1.98	152.5	31.11	29.9	30.8	1.01
149	500	0.4405	1.985	170.4	38.68	33.9	38.8	0.998
150	550	0.4005	1.997	188.4	47.04	37.9	47.4	0.993
151	600	0.3652	2.026	206.7	56.6	42.2	57	0.993
152	650	0.338	2.056	224.7	66.48	46.4	66.8	0.996
153	700	0.314	2.085	242.6	77.26	50.5	77.1	1
154	750	0.2931	2.119	260.4	88.84	54.9	88.4	1
155	800	0.2739	2.152	278.6	101.7	59.2	100	1.01
156	850	0.2579	2.186	296.9	115.1	63.7	113	1.02

Now, write VBA Functions for rho\_v, cp\_v, mu\_v and k\_v as functions of Temp (K). Linear interpolation is used to get the properties at the required temp.

**For rho\_v:**

```

Function Steam_rho_T(T As Double) As Double
'gives density of steam (water vap.) (kg/m^3) as a function of T (K) at 1 atm.
'Reads rho values from Table and interpolates

Dim i As Integer

Dim T_1 As Double, T_2 As Double, rho_1 As Double, rho_2 As Double

If T < 380 Or T > 850 Then

    MsgBox ("T must be between 380 K and 850 K !!")
    End
    End If

For i = 0 To 10

    If Cells(146 + i, 12) = T Then
        Steam_rho_T = Cells(146 + i, 13)
    End If
    If Cells(146 + i, 12) < T And Cells(146 + i + 1, 12) > T Then
        T_1 = Cells(146 + i, 12).Value
        T_2 = Cells(146 + i + 1, 12).Value
        rho_1 = Cells(146 + i, 13).Value
        rho_2 = Cells(146 + i + 1, 13).Value
        Steam_rho_T = (rho_1 + (T - T_1) * (rho_2 - rho_1) / (T_2 - T_1))
    End If

Next i

End Function

```

**For cp\_v:**

```
Function Steam_cp_T(T As Double) As Double
'gives sp. heat of steam (water vap.) (J/kg.K) as a function of T (K) at 1 atm.
'Reads cp values from Table and interpolates

Dim i As Integer

Dim T_1 As Double, T_2 As Double, cp_1 As Double, cp_2 As Double

If T < 380 Or T > 850 Then

MsgBox ("T must be between 380 K and 850 K !!")
End
End If

For i = 0 To 10

If Cells(146 + i, 12) = T Then
Steam_cp_T = Cells(146 + i, 14) * 10 ^ -3
End If
If Cells(146 + i, 12) < T And Cells(146 + i + 1, 12) > T Then
T_1 = Cells(146 + i, 12).Value
T_2 = Cells(146 + i + 1, 12).Value
cp_1 = Cells(146 + i, 14).Value
cp_2 = Cells(146 + i + 1, 14).Value
Steam_cp_T = (cp_1 + (T - T_1) * (cp_2 - cp_1) / (T_2 - T_1)) * 10 ^ -3
End If

Next i

End Function
```

---

**For mu\_v:**

```
Function Steam_mu_T(T As Double) As Double
'gives dyn. visc. of steam (water vap.) (N.s/m^2) as a function of T (K) at 1 atm.
'Reads mu values from Table and interpolates

Dim i As Integer

Dim T_1 As Double, T_2 As Double, mu_1 As Double, mu_2 As Double

If T < 380 Or T > 850 Then

MsgBox ("T must be between 380 K and 850 K !!")
End
End If

For i = 0 To 10

If Cells(146 + i, 12) = T Then
Steam_mu_T = Cells(146 + i, 15) * 10 ^ -7
End If
If Cells(146 + i, 12) < T And Cells(146 + i + 1, 12) > T Then
T_1 = Cells(146 + i, 12).Value
T_2 = Cells(146 + i + 1, 12).Value
mu_1 = Cells(146 + i, 15).Value
mu_2 = Cells(146 + i + 1, 15).Value
Steam_mu_T = (mu_1 + (T - T_1) * (mu_2 - mu_1) / (T_2 - T_1)) * 10 ^ -7
End If

Next i

End Function
```

---

For k\_v:

```
Function Steam_k_T(T As Double) As Double
'gives thermal cond. of steam (water vap.) (W/m.K) as a function of T (K) at 1 atm.
'Reads k values from Table and interpolates

Dim i As Integer

Dim T_1 As Double, T_2 As Double, k_1 As Double, k_2 As Double

If T < 380 Or T > 850 Then

MsgBox ("T must be between 380 K and 850 K !!")
End
End If

For i = 0 To 10

If Cells(146 + i, 12) = T Then
Steam_k_T = Cells(146 + i, 17) * 10 ^ -3
End If
If Cells(146 + i, 12) < T And Cells(146 + i + 1, 12) > T Then
T_1 = Cells(146 + i, 12).Value
T_2 = Cells(146 + i + 1, 12).Value
k_1 = Cells(146 + i, 17).Value
k_2 = Cells(146 + i + 1, 17).Value
Steam_k_T = (k_1 + (T - T_1) * (k_2 - k_1) / (T_2 - T_1)) * 10 ^ -3
End If

Next i

End Function
```

---

ORACLE®

ORACLE IS THE **INFORMATION** COMPANY

Now, have VBA Functions for Boiling heat transfer calculations:

1. For Nucleate boiling flux:

```
Function Boiling_water_q_nucleate(T_s As Double, T_sat As Double, C_sf As Double) As Double
'Returns q_nucleate for Water boiling at 1 atm
'Input: T_s (C), T_sat (C), C_sf from Table
'Output: q_nucleate (W/m^2)
'Valid for any geometry
'Reads property values of Water from Table and interpolates using VBA Functions

Dim g As Double
Dim n As Integer
Dim AA As Double, BB As Double, CC As Double

Dim rho_l As Double, rho_v As Double, k_l As Double, mu_l As Double
Dim Pr_l As Double
Dim cp_l As Double, h_fg As Double, sigma As Double

g = 9.81 'm/s^2....accn due to gravity
n = 1

'Properties of Water at T_sat:

rho_l = 1 / SatH2O_vf_T(T_sat + 273.15)
rho_v = 1 / SatH2O_vg_T(T_sat + 273.15)
k_l = SatH2O_kf_T(T_sat + 273.15)
mu_l = SatH2O_mu_f_T(T_sat + 273.15)
cp_l = SatH2O_cp_f_T(T_sat + 273.15)
h_fg = SatH2O_hfg_T(T_sat + 273.15)
sigma = SatH2O_sigmaf_T(T_sat + 273.15)
Pr_l = SatH2O_Pr_f_T(T_sat + 273.15)

AA = mu_l * h_fg
BB = (g * (rho_l - rho_v) / sigma) ^ (1 / 2)
CC = (cp_l * (T_s - T_sat) / (C_sf * h_fg * Pr_l ^ n)) ^ 3

Boiling_water_q_nucleate = AA * BB * CC

End Function
```

---

**2. For Max. flux on a horizontal surface:**

```

Function Boiling_water_HorizlSurface_q_max(T_sat As Double) As Double
'Returns q_max for Water boiling at 1 atm, on a large, flat surface
'Input: T_s (C), T_sat (C), C_sf from Table
'Output: q_max (W/m^2)
'Valid for large, flat surface
'Reads property values of Water from Table and interpolates using VBA Functions

Dim g As Double

Dim AA As Double, BB As Double

Dim rho_l As Double, rho_v As Double, k_l As Double, mu_l As Double
Dim Pr_l As Double
Dim cp_l As Double, h_fg As Double, sigma As Double

g = 9.81 'm/s^2....accn due to gravity

'Properties of Water at T_sat:

rho_l = 1 / SatH2O_vf_I(T_sat + 273.15)
rho_v = 1 / SatH2O_vg_I(T_sat + 273.15)
k_l = SatH2O_kf_I(T_sat + 273.15)
mu_l = SatH2O_muf_I(T_sat + 273.15)
cp_l = SatH2O_cpf_I(T_sat + 273.15)
h_fg = SatH2O_hfg_I(T_sat + 273.15)
sigma = SatH2O_sigmaf_I(T_sat + 273.15)
Pr_l = SatH2O_Prf_I(T_sat + 273.15)

AA = 0.149 * h_fg
BB = (sigma * g * rho_v ^ 2 * (rho_l - rho_v)) ^ (1 / 4)

Boiling_water_HorizlSurface_q_max = AA * BB

End Function

```

---

### 3. For Max. flux on a horizontal cylinder:

```

Function Boiling_water_HorizlCylinder_q_max(T_sat As Double, Rad As Double) As Double
'Returns q_max for Water boiling at 1 atm, on a horizl cylinder
'Input: T_sat (C), Radius (m)
'Output: q_max(W/m^2)
'Valid for horizl cyl
'Reads property values of Water from Table and interpolates using VBA Functions

Dim g As Double, R_prime As Double, q_max_F As Double

Dim AA As Double

Dim rho_l As Double, rho_v As Double, k_l As Double, mu_l As Double
Dim Pr_l As Double
Dim cp_l As Double, h_fg As Double, sigma As Double

g = 9.81 'm/s^2....accn due to gravity

'Properties of Water at T_sat:

rho_l = 1 / SatH2O_vf_T(T_sat + 273.15)
rho_v = 1 / SatH2O_vg_T(T_sat + 273.15)
k_l = SatH2O_kf_T(T_sat + 273.15)
mu_l = SatH2O_muf_T(T_sat + 273.15)
cp_l = SatH2O_cpf_T(T_sat + 273.15)
h_fg = SatH2O_hfg_T(T_sat + 273.15)
sigma = SatH2O_sigmaf_T(T_sat + 273.15)
Pr_l = SatH2O_Pr_T(T_sat + 273.15)

R_prime = Rad * (g * (rho_l - rho_v) / sigma) ^ 0.5

q_max_F = 0.131 * (rho_v) ^ 0.5 * h_fg * (sigma * g * (rho_l - rho_v)) ^ (1 / 4)

AA = 0.89 + 2.27 * Exp(-3.44 * R_prime ^ 0.5)

If R_prime > 3.47 Then

    Boiling_water_HorizlCylinder_q_max = 0.894 * q_max_F

End If

If (R_prime >= 0.15) And (R_prime <= 3.47) Then

    Boiling_water_HorizlCylinder_q_max = q_max_F * AA

End If

End Function

```

---

#### 4. For Film boiling on a horizontal surface-heat tr. coeff. $h_{\text{film}}$ :

```

Function Boiling_water_HorizlSurface_h_film(T_s As Double, T_sat As Double) As Double
'Returns h_film (W/m^2.C) for film boiling with water at 1 atm, on a Horizl surface
'Input: T_s, T_sat (C)
'Valid for Horizl surface
'Reads property values of Water from Table and interpolates using VBA Functions

Dim g As Double

Dim Lambda As Double, C_0 As Double, h_fg_prime As Double

Dim AA As Double, BB As Double

Dim rho_l As Double, rho_v As Double, k_v As Double, mu_v As Double
Dim T_f As Double
Dim cp_v As Double, h_fg As Double, sigma As Double

If (T_s - T_sat) <= 30 Then

    MsgBox ("Use Nucleate Boiling correlations since (T_s - T_sat) <= 30 C !!")

    End

End If

g = 9.81 'm/s^2....accn due to gravity

T_f = (T_s + T_sat) / 2

'Properties of Water at T_sat:

rho_l = 1 / SatH2O_vf_T(T_sat + 273.15)
h_fg = SatH2O_hfg_T(T_sat + 273.15)
sigma = SatH2O_sigmaf_T(T_sat + 273.15)

'For props of vapour:

rho_v = Steam_rho_T(T_f + 273.15)
cp_v = Steam_cp_T(T_f + 273.15)
k_v = Steam_k_T(T_f + 273.15)
mu_v = Steam_mu_T(T_f + 273.15)

Lambda = 2 * Application.Pi() * (sigma / (g * (rho_l - rho_v))) ^ 0.5

C_0 = 0.59

h_fg_prime = h_fg + 0.4 * cp_v * (T_s - T_sat)

AA = (h_fg_prime * g * rho_v * (rho_l - rho_v) * k_v ^ 3)

BB = mu_v * (T_s - T_sat) * Lambda

    Boiling_water_HorizlSurface_h_film = C_0 * (AA / BB) ^ (1 / 4)

End Function

```

---

**5. For Film boiling on a horizontal cylinder-heat tr. coeff.  $h_{\text{film}}$ :**

```

Function Boiling_water_HorizlCyl_h_film(T_s As Double, T_sat As Double, D As Double) As Double
'Returns h_film (W/m^2.C) for film boiling with water at 1 atm, on a Horizl cyl
'Input: T_s, T_sat (C), Dia D (m)
'Valid for Horizl cyl
'Reads property values of Water from Table and interpolates using VBA Functions

Dim g As Double

Dim C_0 As Double, h_fg_prime As Double

Dim AA As Double, BB As Double

Dim rho_l As Double, rho_v As Double, k_v As Double, mu_v As Double
Dim T_f As Double
Dim cp_v As Double, h_fg As Double, sigma As Double

If (T_s - T_sat) <= 30 Then

    MsgBox ("Use Nucleate Boiling correlations since (T_s - T_sat) <= 30 C !!")

    End

End If

g = 9.81 'm/s^2....accn due to gravity

T_f = (T_s + T_sat) / 2

'Properties of Water at T_sat:

rho_l = 1 / SatH2O_vf_T(T_sat + 273.15)
h_fg = SatH2O_hfg_T(T_sat + 273.15)
sigma = SatH2O_sigmaf_T(T_sat + 273.15)

'For props of vapour:

rho_v = Steam_rho_T(T_f + 273.15)
cp_v = Steam_cp_T(T_f + 273.15)
k_v = Steam_k_T(T_f + 273.15)
mu_v = Steam_mu_T(T_f + 273.15)

C_0 = 0.62

h_fg_prime = h_fg + 0.4 * cp_v * (T_s - T_sat)

AA = (h_fg_prime * g * rho_v * (rho_l - rho_v) * k_v ^ 3)

BB = mu_v * (T_s - T_sat) * D

Boiling_water_HorizlCyl_h_film = C_0 * (AA / BB) ^ (1 / 4)

End Function

```

---

Now, let us solve the problem: Let us state the problem again:

**Prob.3.1.16:** A 1 mm dia nickel wire, 150 mm long, is submerged horizontally in water at atm pressure. A steady state voltage of 10 V is applied, and the current flowing is 52.5 A. Find the surface temp of the wire.

**EXCEL Solution:**

Here, Voltage and current are given. Therefore, Total Power,  $Q = (V \cdot I)$  is calculated. Then,  $(Q/\text{Surface area})$  of wire gives the surface heat flux. This should be equal to the Nucleate boiling heat flux, assuming that boiling is in the Nucleate boiling regime. Goal Seek is used to find the value of  $T_s$ .

1. Set up the Excel worksheet, enter data:

	A	B	C	D	E
300					
301		Data:	Fluid =	Water	
302		Surface temp...assumed	T_s	120	C
303		Sat. temp.	T_sat	100.0	C
304		Radius of cyl.	Rad	0.0005	m
305		Water-nickel combination	C_sf	0.006	From Table
306		Length of wire	L	0.15	m
307		Voltage	V	10.000	V
308		Current	I	52.5	A

Cynthia | AXA Graduate

**AXA Global Graduate Program**

Find out more and apply

redefining / standards AXA

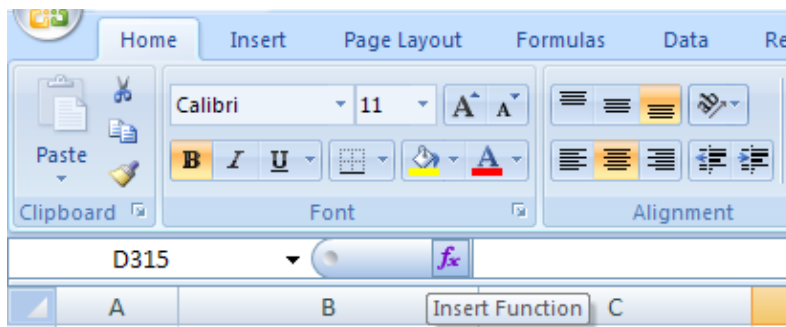

2. Calculate the surface heat flux from the given values of V, I etc.:

	A	B	C	D	E	F
309						
310						
311		Calculations:				
312		Heat gen.	Q	525	W	$Q = V \cdot I$
313		Surface area	A_s	0.000471	m^2	$A_s = 2 \cdot \pi \cdot R \cdot L$
314		heat flux	q_s	1114084.602	W/m^2	$q_s = \frac{Q}{A_s}$

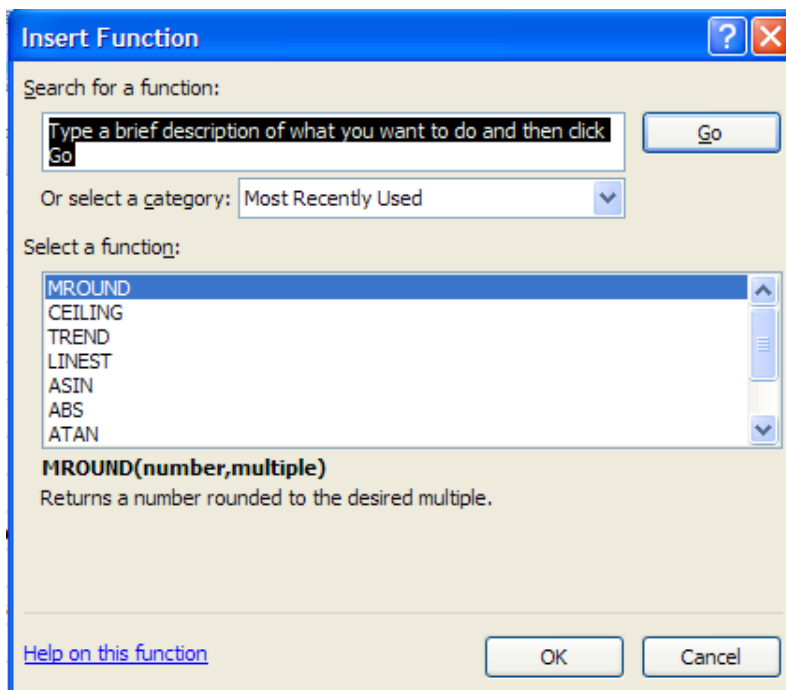

3. Now,  $q_{nucleate}$  is calculated using the VBA Function for Nucleate boiling flux, written earlier.

To insert the VBA Function for  $q_{nucleate}$  in cell D315, we do the following:

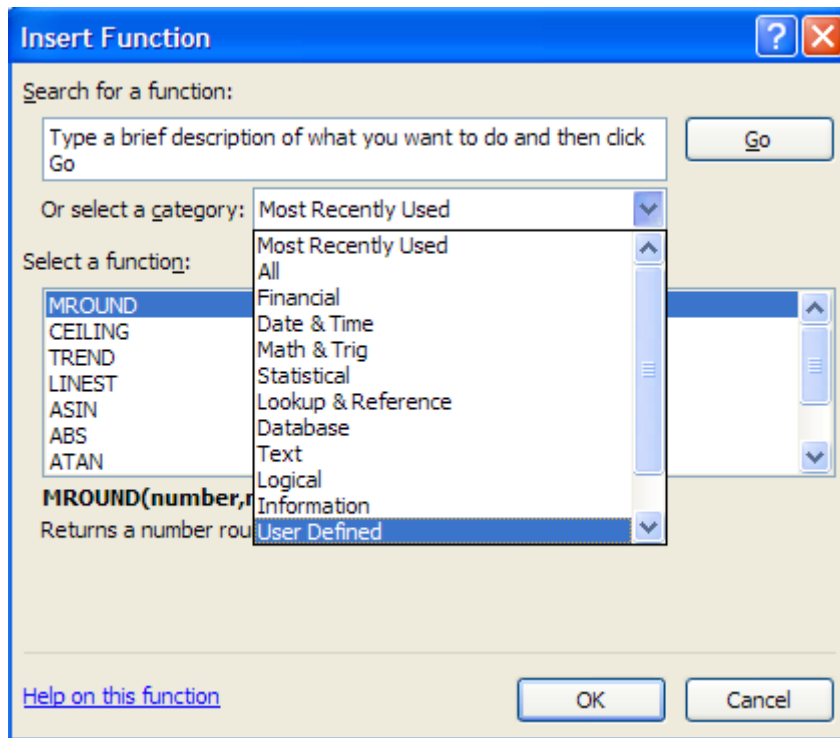

Select cell D315. Then locate the ‘Insert Function’ symbol as shown below:

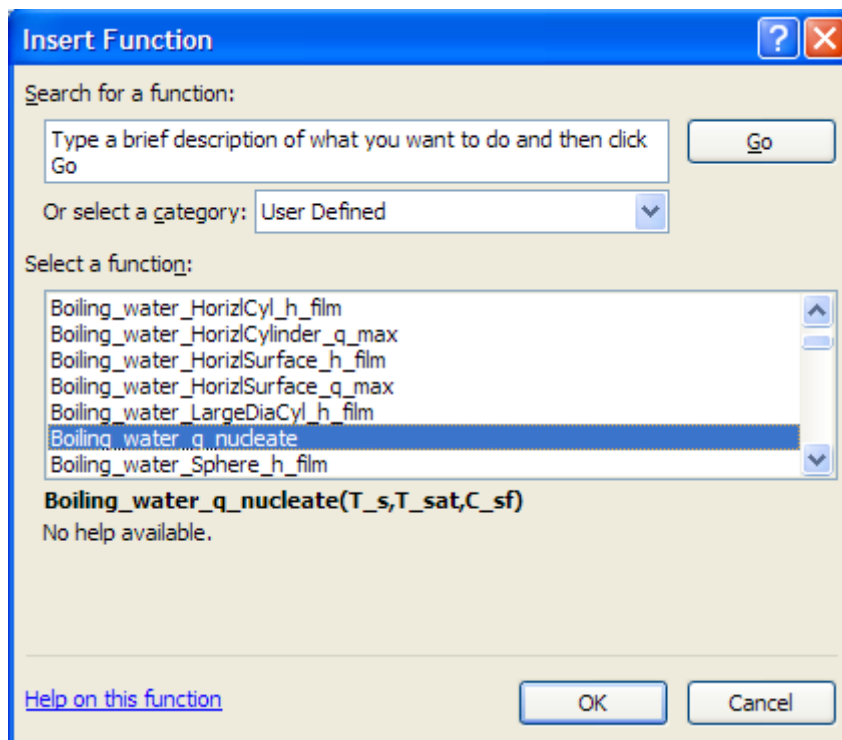

Click on Insert Function symbol. We get:

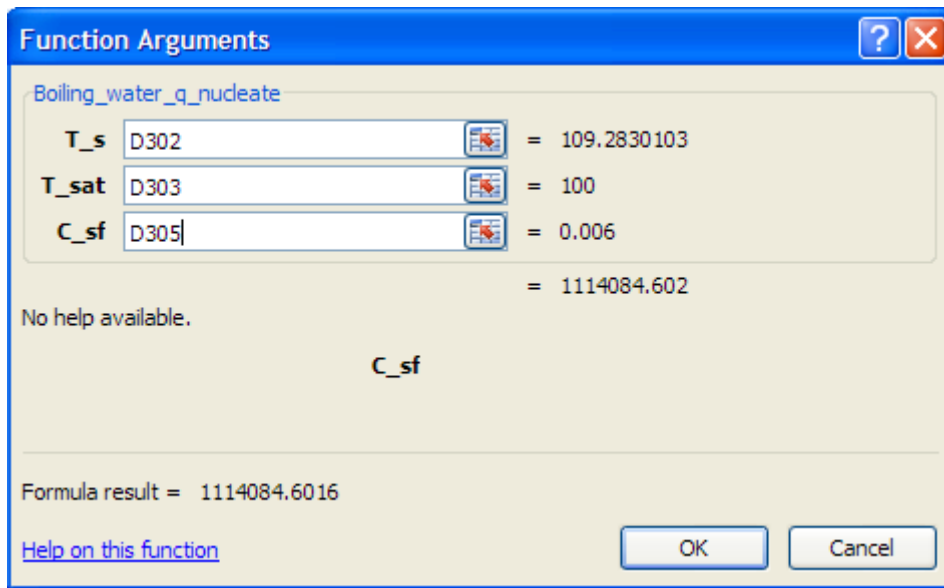

Under Category: select 'User Defined':

Click on 'User Defined'. Several built-in Functions appear. Choose 'Boiling\_Water\_q\_nucleate':

Click OK. We get the following screen. Fill it up as shown:

Click OK. The Function is inserted in cell D315:

	A	B	C	D	E	F	G
309							
310							
311		Calculations:					
312		Heat gen.	Q	525	W	$Q = V \cdot I$	
313		Surface area	A <sub>s</sub>	0.000471	m <sup>2</sup>	$A_s = 2 \cdot \pi \cdot R \cdot L$	
314		heat flux	q <sub>s</sub>	1114084.602	W/m <sup>2</sup>	$q_s = \frac{Q}{A_s}$	
315		q <sub>nucleate</sub> :	q <sub>nucleate</sub>	11141448.6671	W/m <sup>2</sup> ... using VBA Function for Nucleate boiling		
316							
317		Diff=	(q <sub>s</sub> -q <sub>nucleate</sub> )	-10027364.0654704			

Then, in cell D317, we have the difference = (q<sub>s</sub> – q<sub>nucleate</sub>), which should be equal to zero. So, use Goal Seek to make cell D317 equal to zero by changing cell D302 (i.e. T<sub>s</sub>):

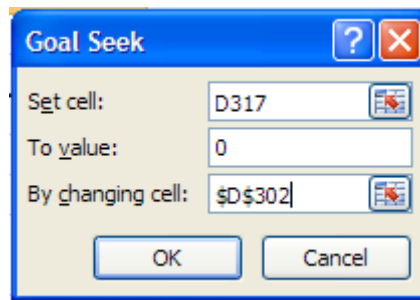

4. Following is the procedure:

Click on Goal Seek. Fill up the screen that appears as follows:

Click OK. We get:

### Masters in Management

Designed for high-achieving graduates across all disciplines, London Business School's Masters in Management provides specific and tangible foundations for a successful career in business.

This 12-month, full-time programme is a business qualification with impact. In 2010, our MiM employment rate was 95% within 3 months of graduation\*; the majority of graduates choosing to work in consulting or financial services.

As well as a renowned qualification from a world-class business school, you also gain access to the School's network of more than 34,000 global alumni – a community that offers support and opportunities throughout your career.

For more information visit [www.london.edu/mm](http://www.london.edu/mm), email [mim@london.edu](mailto:mim@london.edu) or give us a call on +44 (0)20 7000 7573.

316							
317		Diff=	(q <sub>s</sub> -q <sub>nucleate</sub> )	-0.0000006			

Thus: T<sub>s</sub> = 109.283 C .... Ans.

**Prob.3.1.17:** In a laboratory experiment, a 1 mm dia, 30 cm long nickel wire is submerged horizontally in water at 1 atm, and burn-out occurs when a current of 193 A is passed. What is the voltage at burn-out?

**EXCEL Solution:**

Here, we first assume the voltage and calculate the surface heat flux. Then we use the VBA Function to get burn-out (or, Max.) flux for a cylinder and use Goal Seek to find the voltage such that the two heat fluxes are equal:

Following are the steps:

1. Set up the EXCEL worksheet, enter data:

	A	B	C	D	E
324		Data:	Fluid =	Water	
325					
326		Sat. temp.	T <sub>sat</sub>	100.0	C
327		Radius of cyl.	Rad	0.0005	m
328					
329		Length of wire	L	0.3	m
330		Voltage ... assumed	V	10.000	V
331		Current	I	193	A

- Calculate the surface heat flux from given data. Also, calculate the burn-out (or, Max.) heat flux from the VBA Function written earlier:

	A	B	C	D	E	F	G
333							
334		Calculations:					
335		Heat gen.	Q	1930	W	$Q = V \cdot I$	
336		Surface area	A_s	0.000942	m <sup>2</sup>	$A_s = 2 \cdot \pi \cdot R \cdot L$	
337		heat flux	q_s	2047793.601	W/m <sup>2</sup>	$q_s = \frac{Q}{A_s}$	
338		Max. heat flux:	q_max	1524949.916	W/m <sup>2</sup>	...from VBA Function for Max. heat flux	
339		Diff =	(q_s - q_max)	522843.685	W/m <sup>2</sup>		
340							

In the above, in cell D338, q\_max is calculated using the VBA Function for q\_max for a horizontal cylinder. See the previous problem for the procedure to insert the VBA Function. The eqn can be seen in the Formula bar.

- Now, in cell D339, we have the difference: (q\_s – q\_max), which should be equal to zero. So, apply Goal Seek to make cell D339 equal to zero by changing cell D330 (i.e. vlue of voltage, V):

For procedure of Goal Seek, see problem 3.1.16.

We get:

Click OK. We get:

And, the result is:

	A	B	C	D	E	F	G
324		Data:	Fluid =	Water			
325							
326		Sat. temp.	T_sat	100.0	C		
327		Radius of cyl.	Rad	0.0005	m		
328							
329		Length of wire	L	0.3	m		
330		Voltage ... assumed	V	7.447	V		
331		Current	I	193	A		
332							
333							
334		Calculations:					
335		Heat gen.	Q	1437.231436	W		
336		Surface area	A_s	0.000942	m^2		
337		heat flux	q_s	1524949.916	W/m^2		
338		Max. heat flux:	q_max	1524949.916	W/m^2...from VBA Function for Max. heat flux		
339		Diff =	(q_s - q_max)	0.000	W?m^2		

Thus: the voltage at burn-out is: 7.447 V....Ans.

=====  
**Prob.3.1.18:** A steel bar, 20 mm in diameter and 200 mm long, with an emissivity of 0.9, is removed from a furnace at 455 C and suddenly submerged in a water bath under atmospheric pressure. Estimate the initial heat transfer rate from the bar.

**EXCEL Solution:**

It is obviously heat transfer in the Film boiling region since  $\Delta T_e > 30$  C.

We shall use the VBA Function written above to get film boiling heat transfer coeff. for a horizontal cylinder.

Following are the steps:

1. Set up the EXCEL worksheet, enter data:

	A	B	C	D	E
345		Data:	Fluid =	Water	
346		Surface temp	T_s	455	C
347		Sat. temp.	T_sat	100.0	C
348		Dia of cylinder	D	0.0200	m
349		Length of cyl	L	0.2	m
350		emissivity	epsilon	0.9	
351		Stefan Boltzmann const.	sigma	5.67E-08	W/m^2.K^4
352					

2. Find the film boiling heat transfer coeff. h<sub>film</sub> using the VBA Function. Then, calculate the Q<sub>boiling</sub> and also the Q<sub>radn</sub>, and add them up. Formulas used are also shown, in the following worksheet, for clarity:

D357		fx =Boiling_water_HorizCyl_h_film(D346,D347,D348)					
	A	B	C	D	E	F	G
345		Data:	Fluid =	Water			
346		Surface temp	T_s	455	C		
347		Sat. temp.	T_sat	100.0	C		
348		Dia of cylinder	D	0.0200	m		
349		Length of cyl	L	0.2	m		
350		emissivity	epsilon	0.9			
351		Stefan Boltzmann const.	sigma	5.67E-08	W/m^2.K^4		
352							
353							
354							
355		Calculations:					
356							
357		film heat tr coeff.	h_film	150.3956	W/m^2.C	$Q_b = h_{film} \cdot (\pi \cdot D \cdot L) \cdot (T_s - T_{sat})$	
358		boiling heat tr. rate	Q_b	670.924	W		
359		radn heat tr. rate	Q_rad	167.7068	W	$Q_{rad} = \sigma \cdot \epsilon \cdot (\pi \cdot D \cdot L) \cdot [(T_s + 273)^4 - (T_{sat} + 273)^4]$	
360		Total heat tr rate:	(Q_b + Q_rad) =	838.631	W....Ans.		

In the above, note in the Formula bar the Function used to calculate h<sub>film</sub> for horizontal cylinder.

**Thus: Total initial heat transfer rate from the bar = 838.63 W ..... Ans.**

=====

**Prob.3.1.19:** Water at 5 bar flows inside a vertical tube of 2.5 cm dia under flow boiling conditions. Tube wall temp is maintained at 10 C above the sat. temp. Determine the heat transfer for 1 m length of tube.  
 (b) What will be the heat transfer if the tube is horizontal?

**EXCEL Solution:**

**This is an internal flow boiling problem.**

Following is the EXCEL worksheet:

	B	C	D	E	F	G	H
366	Data:	Fluid =	Water				
367	Temp. difference	DELTA T_e	10	C			
368	ID of tube	D	0.0250	m			
369	Length of tube	L	1	m			
370	Pressure	P	0.5	Mpa			
371	If tube is vertical:						
372	heat tr. coeff.	h	3.51E+03	W/m^2.C	←	$h = 2.54 \cdot \Delta T_e^3 \cdot \exp\left(\frac{P}{1.551}\right)$	
373	Heat transfer	Q	2753.773818	W/m...Ans.	←	$Q = h \cdot (\pi \cdot D \cdot L) \cdot \Delta T_e$	
374							
375	If tube is horizontal:						
376		h	20547.60421	W/m^2.C	←	$h = 2.253 \cdot \Delta T_e^{3.96}$ W/m^2.....for 0.2 < P < 0.7 MPa	
377		Q	16138.05061	W/m...Ans.	←	$Q = h \cdot (\pi \cdot D \cdot L) \cdot \Delta T_e$	
378							

Formulas used are also shown in the worksheet.

Thus:

**For vertical tube:  $h = 3510 \text{ W/m}^2\text{.C}$ ,  $Q = 2753.8 \text{ W/m} \dots \text{Ans.}$**

**For horizontal tube:  $h = 20547.6 \text{ W/m}^2\text{.C}$ ,  $Q = 16138.1 \text{ W/m} \dots \text{Ans.}$**

**Prob.3.1.20:** A 1 mm dia nickel wire, 150 mm long, is submerged horizontally in water at atm pressure. The surface temp of the wire is 110 C. Find the nucleate boiling flux.

(b) If the water is flowing normal to the wire at 3 m/s, what will be the change in heat flux?

(c) What should be the flow velocity to make convective heat flux equal to the boiling heat flux?

**EXCEL Solution:**

**This Problem is on external flow boiling.**

First, we will find out nucleate boiling flux,  $q_{\text{boiling}}$  using the VBA Function already written.

Then, we will find out the convection flux,  $q_{conv}$  using relation for cross flow of water over a cylinder.

And, total heat flux is:  $q_{total} = q_{conv} + q_{boiling}$

Following are the steps:

1. Set up the EXCEL worksheet, enter data:

	A	B	C	D	E
383		<b>Data:</b>	<b>Fluid =</b>	<b>Water</b>	
384		<b>Surface temp</b>	<b>T<sub>s</sub></b>	<b>110</b>	<b>C</b>
385		<b>Sat. temp.</b>	<b>T<sub>sat</sub></b>	<b>100.0</b>	<b>C</b>
386		<b>Radius of cyl.</b>	<b>Rad</b>	<b>0.0005</b>	<b>m</b>
387		<b>Water-nickel combination</b>	<b>C<sub>sf</sub></b>	<b>0.006</b>	<b>From Table</b>
388		<b>Length of wire</b>	<b>L</b>	<b>0.15</b>	<b>m</b>
389		<b>Velocity</b>	<b>U<sub>inf</sub></b>	<b>3.000</b>	<b>m/s</b>

2. Now, calculate the nucleate boiling flux using the VBA Function in cell D393. For the method of entering the Function, see Problem 3.1.16. Following is the result:

D393		=Boiling_water_q_nucleate(D384,D385,D387)				
A	B	C	D	E	F	G
383	Data:	Fluid =	Water			
384	Surface temp	T_s	110	C		
385	Sat. temp.	T_sat	100.0	C		
386	Radius of cyl.	Rad	0.0005	m		
387	Water-nickel combination	C_sf	0.006	From Table		
388	Length of wire	L	0.15	m		
389	Velocity	U_inf	3.000	m/s		
390						
391	Calculations:					
392						
393	q_nucleate:	q_nucleate	1392681.0834	W/m^2 ... using VBA Function for Nucleate boiling		

Thus,  $q_{\text{boiling}} = 1392681.08 \text{ W/m}^2$ .

3. Next step is to find out the convection flux,  $q_{\text{conv}}$ . For cross flow over a cylinder, we use **Churchill and Bernstein equation:**

$$\text{Nu}_{\text{cyl}} = \frac{h \cdot D}{k} = 0.3 + \frac{0.62 \cdot \text{Re}^{\frac{1}{2}} \cdot \text{Pr}^{\frac{1}{3}}}{\left[ 1 + \left( \frac{\text{Re}}{28200} \right)^{\frac{5}{8}} \right]^{\frac{4}{5}}} \cdot \left[ 1 + \left( \frac{0.4}{\text{Pr}} \right)^{\frac{2}{3}} \right]^{\frac{1}{4}} \quad \dots(9.90)$$

Eqn. (9.90) is valid for  $100 < \text{Re} < 10^7$ , and  $\text{Re} \cdot \text{Pr} > 0.2$  and correlates very well all available data.

Fluid properties are evaluated at ‘film temperature’,  $T_f = (T_s + T_a)/2$  = average of surface and free stream temperatures.

We use properties of liquid at  $T_f$ , and assume zero vapour production:

4. Get the Fluid properties by using the VBA Functions written earlier for Sat. water:

D403		fx =SatH2O_Pr_f_T((D397+273.15))	
A	B	C	D
395	For q_conv		
397	Film temp	T_f	105
398	Liq. Props at Tf:		
399	density	rho_L	956.3246531
400	dyn. Viscosity	mu_L	0.00026518
401	th. cond.	k_L	0.68226
402	Reynolds No. assuming no vapour generation	Re_liq	10818.96809
403	Prandtl No.	Pr_liq	1.6433

$$Re_{liq} = \frac{(R-2) \cdot U_{inf} \cdot \rho_{liq}}{\mu_{liq}}$$

In the above worksheet, Reynolds No. is calculated using properties of liquid.

5. Next, calculate the Nusselts No. for cross flow over a cylinder. In the worksheet shown below, the eqn for Nusselts No. is calculated in parts, for clarity. From Nusselts no., calculate  $h_{conv}$ , and then  $q_{conv}$ , as shown:

D413		fx =D393+D411	
B	C	D	E
404	To calculate Nusselts No.:		
405		AA	76.10097622
406		BB	1.085779992
407		CC	1.419551688
408	Nusselts No.	Nusselts	99.79462145
409			
410	conv. heat tr. coeff	h_conv	68085.87843
411	conv. Flux	q_conv	680858.7843
412	Therefore:		
413	Total heat flux:	q_tot = q_nucleate+q_conv	2.07354E+06
414			
415			
416			
417			
418			
419			
420			
421			
422			

$$Nu_{cyl} = 0.3 + \frac{AA \cdot CC}{BB}$$

$$AA = 0.62 \cdot Re_{liq}^{0.5} \cdot Pr_{liq}^{\frac{1}{3}}$$

$$BB = \left[ 1 + \left( \frac{0.4}{Pr_{liq}} \right)^{\frac{1}{4}} \right]^{\frac{1}{4}}$$

$$CC = \left[ 1 + \left( \frac{Re_{liq}}{28200} \right)^{\frac{5}{8}} \right]^{\frac{4}{5}}$$

$$h_{conv} = \frac{Nusselts \cdot k_{liq}}{(R-2)}$$

$$q_{conv} = h_{conv} \cdot (T_s - T_{sat})$$

Thus:

Nucleate boiling flux,  $q_{boiling} = 1392681.08 \text{ W/m}^2$ .

Conv. heat flux =  $q_{conv} = 680858.78 \text{ W/m}^2$

Total heat flux =  $q_{total} = 2.07354E06 \text{ W/m}^2 \dots \text{Ans.}$

**6. What should be the flow velocity to make convective heat flux equal to the boiling heat flux?**

We see from the above calculations that nucleate boiling heat flux is independent of velocity.

Convective heat flux is, of course, dependent on velocity.

To find the velocity which will make  $q_{conv}$  equal to  $q_{boiling}$ , we enter  $(q_{conv} - q_{boiling})$  in cell D416.

D416		fx =D411-D393		
	B	C	D	E
411	conv. Flux	$q_{conv}$	680858.7843	W/m <sup>2</sup> ...
412	Therefore:			
413	Total heat flux:	$q_{tot} = q_{nucleate} + q_{conv}$	2.07354E+06	W/m <sup>2</sup> ....Ans.
414				
415				
416	Diff=	$(q_{conv} - q_{boiling}) =$	-711822.2991	
417				

And, apply Goal Seek to make cell D416 zero by changing cell D389 (i.e. value of velocity,  $U_{inf}$ ).

As a leading technology company in the field of geophysical science, PGS can offer exciting opportunities in offshore seismic exploration.

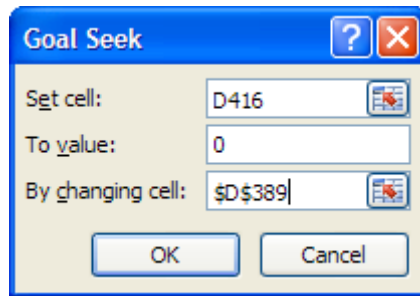

We are looking for new BSc, MSc and PhD graduates with Geoscience, engineering and other numerate backgrounds to join us.

To learn more our career opportunities, please visit [www.pgs.com/careers](http://www.pgs.com/careers)

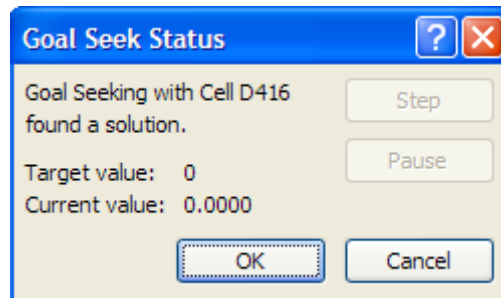

For procedure of Goal Seek, see problem 3.1.16.

We get:

Click OK. We get:

Again, click OK.

And, the result is:

**$U_{inf} = 8.181 \text{ m/s} \dots \text{Ans.}$**

=====

**Prob.3.1.21:** Estimate the flow velocity that would be necessary to produce a value of  $h$  for forced convection through a smooth, 6.5 mm dia brass tube comparable with that which could be obtained by pool boiling with  $\Delta T_e = 15 \text{ C}$ , and  $P = 6.9 \text{ bar}$ , and water as the fluid. Take  $T_{sat} = 164 \text{ C}$ , and  $h_{fg} = 2.068E06 \text{ J/kg}$  at 6.9 bar.

**EXCEL Solution:**

First, find the Nucleate boiling flux for brass-water combination ( $C_{sf} = 0.006$ ) for the given  $T_s$ ,  $T_{sat}$ .

From the flux, find out  $h_{boiling}$ .

Then, assume a flow velocity ( $U_{inf}$ ) and find  $h_{conv}$  using Dittus – Boelter eqn for Nusselts No. with the constant = 0.019 (instead of 0.023).

Next, apply Goal Seek to make both the  $h_{conv}$  and  $h_{boiling}$  equal, by changing velocity,  $U_{inf}$ .

Following are the steps:

1. Set up the worksheet, enter data:

	B	C	D	E
429				
430	<b>Data:</b>	<b>Fluid =</b>	<b>Water</b>	
431	<b>Surface temp</b>	<b>T_s</b>	<b>179</b>	C
432	<b>Sat. temp.</b>	<b>T_sat</b>	<b>164.0</b>	C
433	<b>Radius of cyl.</b>	<b>Dia</b>	<b>0.0065</b>	m
434	<b>Water-brass combination</b>	<b>C_sf</b>	<b>0.006</b>	From Table
435				
436	<b>Velocity .... Assumed</b>	<b>U_inf</b>	<b>3.000</b>	m/s
437				

2. First, calculate  $q_{nucleate}$  using the VBA Function for nucleate boiling. Then,  $h_{boiling} = q_{nucleate} / \Delta T$ .

Now, get properties of water at bulk mean temp  $T_f = T_{sat} + \Delta T/2 = 171.5$  C.

Following worksheet shows these calculations:

	A	B	C	D	E	F	G
442							
443		q_nucleate:	q_nucleate	18511560.8215	W/m^2 ... using VBA Function for Nucleate boiling		
444		boiling, heat tr coeff	h_boiling	1234104.055	W/m^2.C	$h_{boiling} = q_{nucleate} / \Delta T$	
445							
446		Film temp	T_f	171.5	C		
447		<b>Liq. Props at Tf:</b>					
448		density	rho_L	895.8345931	kg/m^3		
449		dyn. Viscosity	mu_L	0.000157583	N.s/m^2		
450		th. cond.	k_L	0.6799075	W/m.C		
451		Reynolds No. assuming no vapour generation	Re_liq	110854.7876		$Re = D * U_{inf} * rho_{liq} / mu_{liq}$	
452		Prandtl No.	Pr_liq	1.019075			

The Function for  $q_{nucleate}$ , entered in cell D443 can be seen in the Formula bar.

For convection calculations, we are taking properties of liquid only, and assume zero vapour production.

3. Now, find Reynolds No. =  $D * U_{inf} * \rho / \mu$ . Then, apply Dittus \_ Boelter eqn (with constant = 0.019 instead of 0.023) to get Nusselts No. i.e.

$$Nusselts = 0.019 * Re^{0.8} * Pr^{0.4}$$

And, next, find  $h_{conv}$  from:

$$h_{conv} = Nusselts * k_{liq} / D$$

Following worksheet shows these calculations:

D456		fx =D454*D450/D433				
	B	C	D	E	F	G
453	To calculate Nusselts No.:					
454		Nusselts	207.8929	←	$Nusselts = 0.019 * Re^{0.8} * Pr^{0.4}$	
455						
456	conv. heat tr. coeff	$h_{conv}$	21745.83551	←	$h_{conv} = Nusselts * k_{liq} / D$	

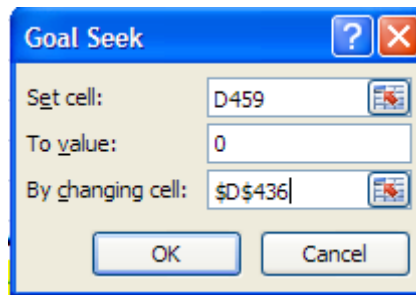

Click on the ad to read more

4. Now, all the above calculations were with the assumed value of 3 m/s for the velocity,  $U_{inf}$ . Now, enter  $(h_{boiling} - h_{conv})$  in cell D459 and apply Goal Seek to make this cell equal to zero by changing cell D436 (i.e. value of  $U_{inf}$ ).

	B	C	D	E
456	conv. heat tr. coeff	<b>h_conv</b>	<b>21745.83551</b>	W/m <sup>2</sup> .C
457				
458				
459	Diff =	<b>(h_boiling - h_conv)</b>	<b>1212358.219</b>	W/m <sup>2</sup> .C
460				

For procedure of Goal Seek, see problem 3.1.16.

We get:

Click OK. We get:

Again, click OK.

And, the result is:

**$U_{inf} = 467.295 \text{ m/s} \dots \text{Ans.}$**

i.e. quite a high value of velocity is required to get this heat flux in forced convection.

=====

**Prob.3.1.22:** Water at 1 atm, with a mean velocity of 1.5 m/s and a mean temp of 95 C flows through a 15 mm dia brass tube, whose surface is at 110 C. Estimate the heat transfer rate per unit length. (Ref. 3)

**EXCEL Solution:**

Here, combine the separate effects of forced convection and nucleate boiling.

First, find the Nucleate boiling flux for brass-water combination ( $C_{sf} = 0.006$ ) for the given  $T_s$ ,  $T_{sat}$ .

Then, find  $h_{conv}$  using Dittus-Boelter eqn for Nusselts No. with the constant = 0.019 (instead of 0.023), and then find out  $q_{conv}$ .

Following are the steps:

1. Set up the worksheet, enter data:

	B	C	D	E
466	Data:	Fluid =	Water	
467	Surface temp	T_s	110	C
468	Sat. temp.	T_sat	100.0	C
469	Dia of cyl.	Dia	0.0150	m
470	Water-brass combination	C_sf	0.006	From Table
471				
472	Velocity	U_inf	1.500	m/s
473				

2. First, calculate  $q_{nucleate}$  using the VBA Function for nucleate boiling. Now, get properties of water at bulk mean temp  $T_f = 95$  C.

Following worksheet shows these calculations:

	B	C	D	E	F	G
476						
477	Calculations:					
478						
479	q_nucleate:	q_nucleate	1392681.0834	W/m^2 ... using VBA Function for Nucleate boiling		
480						
481						
482	Mean bulk temp	T_f	95	C		
483	Liq. Props at Tf:					
484	density	rho_L	961.6401735	kg/m^3		
485	dyn. Viscosity	mu_L	0.00029529	N.s/m^2		
486	th. cond.	k_L	0.67826	W/m.C		
	Reynolds No. assuming no vapour generation	Re_liq	73273.40548			
487		Pr_liq	1.8407			
488	Prandtl No.					

$Re = D * U\_inf * rho\_liq / mu\_liq$

The Function for  $q_{nucleate}$ , entered in cell D479 can be seen in the Formula bar.

For convection calculations, we are taking properties of liquid only, and assume zero vapour production.

1. Now, find Reynolds No. =  $D * U_{inf} * \rho / \mu$ . Then, apply Dittus \_ Boelter eqn (with constant = 0.019 instead of 0.023) to get Nusselts No. i.e.

$$Nusselts = 0.019 * Re^{0.8} * Pr^{0.4}$$

And, next, find  $h_{conv}$  from:

$$h_{conv} = Nusselts * k_{liq} / D$$

And, the convective heat flux from:

$$q_{conv} = h_{conv} * (T_s - T_f)$$

Then,  $Q_{total}$  for unit length is calculated as:

$$Q_{tot} = (q_{boiling} + q_{conv}) * (\pi * D)$$

**Technical training on  
WHAT you need, WHEN you need it**

At IDC Technologies we can tailor our technical and engineering training workshops to suit your needs. We have extensive experience in training technical and engineering staff and have trained people in organisations such as General Motors, Shell, Siemens, BHP and Honeywell to name a few.

Our onsite training is cost effective, convenient and completely customisable to the technical and engineering areas you want covered. Our workshops are all comprehensive hands-on learning experiences with ample time given to practical sessions and demonstrations. We communicate well to ensure that workshop content and timing match the knowledge, skills, and abilities of the participants.

We run onsite training all year round and hold the workshops on your premises or a venue of your choice for your convenience.

For a no obligation proposal, contact us today at [training@idc-online.com](mailto:training@idc-online.com) or visit our website for more information: [www.idc-online.com/onsite/](http://www.idc-online.com/onsite/)

**IDC TECHNOLOGIES**

Following worksheet shows these calculations:

	C	D	E	F	G	H
488	Pr_liq	1.8407				
489			$Nusselts = 0.019 * Re^{0.8} * Pr^{0.4}$			
490	Nusselts	189.1054	$h_{conv} = Nusselts * k_{liq} / D$			
491						
492	h_conv	8550.841444	W/m^2.C			
493	q_conv	128262.6217	W/m^2	$q_{conv} = h_{conv} * (T_s - T_f)$		
494						
495	Q_tot	71672.78355	W/m....Ans.	$Q_{tot} = (q_{boiling} + q_{conv}) * (\pi * D)$		

Thus: Total heat transfer from the tube =  $Q_{tot} = 71672.8 \text{ W/m} \dots \text{Ans.}$

### 3.2 Condensation:

Formulas used:

Film condensation and flow regimes: (Ref. 1)

Consider film condensation of a vapour at saturation temperature  $T_{sat}$  on the surface of a cooled vertical plate, maintained at a temperature  $T_s (< T_{sat})$ . See Fig. 11.7.

Fig. 11.7 Film condensation on a vertical plate

Vapour condenses on the top of the plate and flows down as a film. Thickness of the film ( $\delta$ ) is zero at the top of the plate (i.e. at  $x = 0$  in the coordinate system shown) and increases as we travel down the plate (i.e. as  $x$  increases) due to additional condensation of vapour.

Initially, the liquid film flow is **laminar**; after some distance it will become **wavy** and later, it may even turn **turbulent**. These different flow regimes are identified according to a '**film Reynolds number**', defined as follows:

$$\text{Re}_f = \frac{D_h \cdot \rho_L \cdot V_L}{\mu_L} = \frac{4 \cdot A_c \cdot \rho_L \cdot V_L}{P \cdot \mu_L} = \frac{4 \cdot \rho_L \cdot V_L \cdot \delta}{\mu_L} = \frac{4 \cdot m}{P \cdot \mu_L} \quad \dots(11.32)$$

where

$$D_h = 4 A_c / P = 4 \cdot \delta = \text{hydraulic dia. of condensate flow, m}$$

$$P = \text{wetted perimeter of condensate, m}$$

$$A_c = P \cdot \delta = \text{area of cross-section of flow at the lowest part of flow, m}^2$$

$$\rho_L = \text{density of liquid, kg/m}^3$$

$$\mu_L = \text{viscosity of liquid, kg/m.s}$$

$$V_L = \text{average velocity of condensate at the lowest part of flow, m/s}$$

$$\rho_L A V_L = m = \text{mass flow rate of condensate at the lowest part of flow, kg/s}$$

For the common geometries of a vertical plate, vertical cylinder and a horizontal cylinder, **hydraulic diameter  $D_h$  is equal to 4 times the thickness of the condensate,  $\delta$ , at the location where the hydraulic diameter is to be evaluated.**

Again, considering eqn. (11.32), for a vertical plate, wetted perimeter,  $P = B$ , the breadth; therefore,  $(m/P)$  is the mass flow rate per unit breadth. If we denote  $(m/P)$  by  $m'$ , we can write for the vertical plate:

$$\text{Re}_f = \frac{4 \cdot m'}{\mu_L} \quad \dots(11.32,a)$$

Rohsenow (1956) suggested that sub-cooling of the liquid can be taken into account by replacing  $h_{fg}$  by a 'modified latent heat of vapourization',  $h'_{fg}$ , defined as:

$$h'_{fg} = h_{fg} + 0.68 \cdot C_{pL} \cdot (T_{sat} - T_s) \quad \dots(11.33)$$

where  $C_{pL}$  is the sp. heat of liquid at the average film temperature.

Similarly, if a superheated vapour at a temperature,  $T_v$ , enters a condenser and condenses, the superheated vapour has to be cooled to  $T_{sat}$  first, and then condensed at  $T_{sat}$ , and then sub-cooled to some temperature between  $T_s$  and  $T_{sat}$ . Then. Modified latent heat of vapourization is:

$$h'_{fg} = h_{fg} + 0.68 \cdot C_{pL} \cdot (T_{sat} - T_s) + C_{pV} \cdot (T_v - T_{sat}) \quad \dots(11.34)$$

where  $C_{pV}$  is the sp. heat of vapour at the *average* temperature of  $(T_v + T_{sat})/2$ .

Then, rate of heat transfer in condensation becomes:

$$Q_{conden} = h \cdot A \cdot (T_{sat} - T_s) = m \cdot h'_{fg} \quad \dots(11.35)$$

where A is the surface area on which condensation occurs.

**TU Delft** Delft University of Technology  
Challenge the future

Then, from eqn. (11.35) and (11.32), we can write:

$$Re_f = \frac{4 \cdot Q_{\text{conden}}}{P \cdot \mu_L \cdot h'_{fg}} = \frac{4 \cdot A \cdot h \cdot (T_{\text{sat}} - T_s)}{P \cdot \mu_L \cdot h'_{fg}} \quad \dots(11.36)$$

When either  $Q_{\text{conden}}$  or  $h$  is known, it is convenient to use eqn. (11.36) to determine  $Re_f$ .

**Now, different flow regimes are identified according to the value of  $Re_f$  as follows:**

$Re_f \leq 30$  ....Liquid film is smooth and wave-free, i.e. **fully laminar**.

$450 < Re_f < 1800$  ....Liquid film has ripples or waves and the flow is **wavy-laminar**.

$Re_f > 1800$  ....Liquid film is **fully turbulent**.

Heat transfer correlations vary depending upon the flow regime.

**Nusselt's theory for Laminar film condensation on Vertical Plates:**

Velocity profile:

$$u(y) = \frac{g \cdot (\rho_L - \rho_V) \cdot \left( \delta \cdot y - \frac{y^2}{2} \right)}{\mu_L}$$

$$\text{i.e. } u(y) = \frac{g \cdot (\rho_L - \rho_V) \cdot \delta^2}{\mu_L} \cdot \left[ \frac{y}{\delta} - \frac{1}{2} \cdot \left( \frac{y}{\delta} \right)^2 \right] \quad \dots\dots(11.37)$$

And, the mean flow velocity of the liquid at a section is given by:

$$u_m = \frac{g \cdot (\rho_L - \rho_V) \cdot \delta^2}{3 \cdot \mu_L} \quad \dots\dots(11.38)$$

Mass flow rate of condensate through any x-position is given by:

$$m = \frac{\rho_L \cdot (\rho_L - \rho_V) \cdot g \cdot b \cdot \delta^3}{3 \cdot \mu_L} \quad \dots\dots(11.39)$$

The liquid film thickness as a function of position  $x$  is given by:

$$\delta(x) = \left[ \frac{4 \cdot k_L \cdot \mu_L \cdot (T_{\text{sat}} - T_s) \cdot x}{\rho_L \cdot (\rho_L - \rho_V) \cdot g \cdot h_{fg}} \right]^{\frac{1}{4}} \quad \dots(11.43)$$

Local heat transfer coeff. is given by:

$$h_x = \frac{k}{\delta} \quad \dots(11.44)$$

Substituting the value of  $\delta$  from eqn. (11.43) in eqn. (11.44):

$$h_x = \left[ \frac{\rho_L \cdot (\rho_L - \rho_V) \cdot k_L^3 \cdot g \cdot h_{fg}}{4 \cdot \mu_L \cdot x \cdot (T_{\text{sat}} - T_s)} \right]^{\frac{1}{4}} \quad \dots(11.45)$$

At  $x = L$ , i.e. at the lower end of the plate, local heat transfer coeff. is:

$$h_L = \left[ \frac{\rho_L \cdot (\rho_L - \rho_V) \cdot k_L^3 \cdot g \cdot h_{fg}}{4 \cdot \mu_L \cdot L \cdot (T_{\text{sat}} - T_s)} \right]^{\frac{1}{4}} \quad \dots(11.46)$$

**Average value of heat transfer coeff. over the entire height of the plate:**

$$h_{\text{avg}} = \frac{1}{L} \int_0^L h_x dx$$

We get:

$$h_{\text{avg}} = \frac{4}{3} \cdot h_L \quad \dots(11.47)$$

In the above,  $h_L$  is the local heat transfer coeff. at  $x = L$ , i.e. at the lower end of the plate.

We have, for average heat transfer coeff. for laminar film condensation on a vertical plate:

$$h_{avg} = 0.943 \left[ \frac{\rho_L (\rho_L - \rho_V) \cdot k_L^3 \cdot g \cdot h'_{fg}}{\mu_L \cdot L \cdot (T_{sat} - T_s)} \right]^{\frac{1}{4}} \quad W/(m^2.C) \dots \text{for } 0 < Re_f < 30 \dots (11.49)$$

where

$$h'_{fg} = h_{fg} + 0.68 C_{pL} \cdot (T_{sat} - T_s)$$

In the above eqn. all the liquid properties should be evaluated at the film temperature,

$T_f = (T_{sat} + T_s)/2$  and  $h_{fg}$  and  $\rho_V$  should be evaluated at  $T_{sat}$ .

Now, let us define a dimensionless number called ‘**Condensation number**’, ( $Co$ ) [or, ‘modified Nusselt number’] as follows:

$$Co = \frac{h_{avg}}{k_L} \left[ \frac{\mu_L^2}{\rho_L (\rho_L - \rho_V) \cdot g} \right]^{\frac{1}{3}} \quad \dots (11.50, a)$$

Since,  $\rho_L \gg \rho_V$ , condensation number can be simplified as:

$$Co = \frac{h_{avg}}{k_L} \left( \frac{\mu_L^2}{\rho_L \cdot g} \right)^{\frac{1}{3}} = \frac{h_{avg}}{k_L} \left( \frac{\nu_L^2}{g} \right)^{\frac{1}{3}} \quad \dots (11.50, b)$$

Then, Rohsenow (1985) has shown that above derived relation for heat transfer coeff. for condensation on a vertical plate for the laminar regimes of condensate flow, can be recast as follows:

a) **Laminar flow, ( $Re_f \leq 30$ ):**

$$Co = 1.47 \cdot Re_f^{-\frac{1}{3}} \quad \dots \text{laminar} \dots (11.51)$$

b) In the laminar – wavy region, ( $30 < Re_f < 1800$ ):

Kutatelazde recommends following correlation:

$$Co = \frac{Re_f}{1.08 \cdot Re_f^{1.22} - 5.2} \quad \dots \text{laminar-wavy} \dots (11.52)$$

c) For turbulent region, ( $Re_f > 1800$ ):

Labuntsov recommends following correlation for turbulent film condensation:

$$Co = \frac{Re_f}{8750 + 58 \cdot (Re_f^{0.75} - 253) \cdot Pr_L^{-0.5}} \quad \dots \text{turb} \dots (11.53)$$

Eqns. (11.51), (11.52) and (11.53) are depicted graphically in Fig. (11.9) below:

Fig. 11.9 Condensation number vs. film Reynolds number for a vertical plate

Above correlations for condensation on a vertical plate are applicable to condensation inside or outside vertical tubes also, if the tube diameter is not too small.

**Calculation formulas** for all the three regions of film condensation on a vertical plate (or cylinder) are given below (from Ref. 2, Cengel). Here,  $h_{\text{vert}}$  is the average heat transfer coeff over the entire height (L) of the vertical plate.

$\delta_L$  is the thickness of the film at the bottom of the plate, i.e. at  $x = L$ .

**For Laminar film: (i.e.  $0 < Re \leq 30$ ):**

$$\delta_L = \left[ \frac{4 \cdot \mu_L \cdot k_L \cdot (T_{\text{sat}} - T_s) \cdot L}{g \cdot \rho_L \cdot (\rho_L - \rho_V) \cdot h_{\text{fg\_prime}}} \right]^{\frac{1}{4}}$$

$$Re = \frac{4 \cdot g \cdot \rho_L \cdot (\rho_L - \rho_V) \cdot \delta_L^3}{3 \cdot \mu_L^2}$$

$$h_{\text{vert}} = 1.47 \cdot Re^{\frac{-1}{3}} \cdot k_L \cdot \left( \frac{g}{\nu_L^2} \right)^{\frac{1}{3}} \quad \text{if } 0 < Re \leq 30$$

---

**For Laminar-wavy film: (i.e.  $30 < Re \leq 1800$ ):**

$$h_{\text{vert}} = \frac{Re \cdot k_L}{1.08 \cdot Re^{1.22} - 5.2} \cdot \left( \frac{g}{\nu_L^2} \right)^{\frac{1}{3}}$$

$$Re_f = \left[ 4.81 + \frac{3.7 \cdot L \cdot k_L \cdot (T_{\text{sat}} - T_s)}{\mu_L \cdot h_{\text{fg\_prime}}} \cdot \left( \frac{g}{\nu_L^2} \right)^{\frac{1}{3}} \right]^{0.82}$$

---

**For turbulent film: (i.e.  $Re > 1800$ ):**

$$h_{\text{vert}} = \frac{Re \cdot k_L}{8750 + 58 \cdot Pr_L^{-0.5} \cdot (Re^{0.75} - 253)} \cdot \left( \frac{g}{\nu_L^2} \right)^{\frac{1}{3}}$$

$$Re_f = \left[ \frac{0.069 \cdot L \cdot k_L \cdot Pr_L^{0.5} \cdot (T_{\text{sat}} - T_s)}{\mu_L \cdot h_{\text{fg\_prime}}} \cdot \left( \frac{g}{\nu_L^2} \right)^{\frac{1}{3}} - 151 \cdot Pr_L^{0.5} + 253 \right]^{\frac{4}{3}}$$

---

**Film condensation on inclined plates, vertical tubes, horizontal tubes and spheres, and horizontal tube banks:**

If the plate is inclined at an angle of  $\theta$  to the vertical, ( $\theta \leq 60$  deg.), replacing  $g$  by  $g \cdot \cos(\theta)$  in eqn. (11.49) gives satisfactory results for laminar condensation on the upper surface of the inclined plate. i.e.

$$h_{\text{inclined}} = 0.943 \cdot \left[ \frac{\rho_L (\rho_L - \rho_V) \cdot k_L^3 \cdot g \cdot \cos(\theta) \cdot h'_{fg}}{\mu_L \cdot L \cdot (T_{\text{sat}} - T_s)} \right]^{\frac{1}{4}} \quad \text{W/(m}^2 \cdot \text{C)} \dots \text{for } 0 < \text{Re}_f < 30 \dots \dots (11.55)$$

We can also write:

$$h_{\text{inclined}} = h_{\text{vert}} \cdot (\cos(\theta))^{\frac{1}{4}} \quad \dots \text{laminar} \dots (11.56)$$

**Vertical tubes:**

Eqn. (11.49) for laminar condensation on vertical plates can also be used to determine heat transfer coeff. for laminar condensation on the outer or inner surface of a vertical tube, if the tube diameter is large compared to the thickness of the liquid film i.e.

if  $D \gg \delta$ .

Study at one of Europe's leading universities

DTU, Technical University of Denmark, is ranked as one of the best technical universities in Europe, and offers internationally recognised Master of Science degrees in 39 English-taught programmes.

DTU offers a unique environment where students have hands-on access to cutting edge facilities and work

closely under the expert supervision of top international researchers.

DTU's central campus is located just north of Copenhagen and life at the University is engaging and vibrant. At DTU, we ensure that your goals and ambitions are met. Tuition is free for EU/EEA citizens.

**Horizontal tubes and spheres:**

**Horizontal tube-laminar film condensation:**

For laminar film condensation on horizontal tubes and spheres, Nusselt type of analysis gives relations similar to eqn. (11.49), except that L is replaced by diameter D and the value of the numerical constant is different. We get:

$$h_{\text{horiz}} = 0.729 \left[ \frac{\rho_L (\rho_L - \rho_V) \cdot k_L^3 \cdot g \cdot h'_{fg}}{\mu_L \cdot D \cdot (T_{\text{sat}} - T_s)} \right]^{\frac{1}{4}} \quad \text{W/(m}^2\text{.C)...for } 0 < \text{Re}_f < 30 \dots (11.57)$$

**Horizontal tube-forced convection condensation:**

Eqn. (11.57) is for the case of a quiescent vapour condensing on a horizontal tube. However, for condensers used in practice, a vapour may be forced through a condenser while being condensed. For the case of a cylinder of diameter D exposed to cross flow of a vapour with a free stream velocity of U, following correlation due to Shekrliladze and Gomelaury (1966), may be applied:

$$\frac{h_{\text{horiz}} \cdot D}{k} = 0.64 \text{Re}_D^{\frac{1}{2}} \cdot \left[ 1 + \left[ 1 + \frac{1.69 g \cdot h'_{fg} \cdot \mu_L \cdot D}{U^2 \cdot k_L \cdot (T_{\text{sat}} - T_s)} \right]^{\frac{1}{2}} \right]^{\frac{1}{2}} \quad \dots \text{for } \text{Re}_D < 106 \dots (11.57,a)$$

where  $\text{Re}_D = \frac{\rho_L \cdot U \cdot D}{\mu_L}$

**Sphere-laminar film condensation:**

$$h_{\text{sphere}} = 0.815 \left[ \frac{\rho_L (\rho_L - \rho_V) \cdot k_L^3 \cdot g \cdot h'_{fg}}{\mu_L \cdot D \cdot (T_{\text{sat}} - T_s)} \right]^{\frac{1}{4}} \quad \text{W/(m}^2\text{.C)...for } 0 < \text{Re}_f < 30 \dots (11.58)$$

It is interesting to compare the laminar condensation on vertical and horizontal tubes. From eqns. (11.49) and (11.57), we can write:

$$\frac{h_{\text{vert}}}{h_{\text{horiz}}} = \frac{0.943}{0.729} \cdot \left(\frac{D}{L}\right)^{\frac{1}{4}} = 1.294 \left(\frac{D}{L}\right)^{\frac{1}{4}} \quad \dots (11.59)$$

For  $h_{\text{vert}}$  to be equal to  $h_{\text{horiz}}$ , we should have:

$$L = (1.294)^4 \cdot D$$

i.e.

$$L = 2.8 \cdot D$$

i.e. for  $L > 2.8 \cdot D$ , heat transfer coeff. will be higher for a horizontal tube. It is a fact that most of the tubes used in practice have lengths such that  $L > 2.8 \cdot D$ . Therefore, tubes used in a steam condenser are generally arranged in a horizontal orientation.

### Horizontal tube banks:

Average heat transfer coeff. for film condensation on a vertical tier containing  $N$  tubes is obtained by substituting  $(N \cdot D)$  in place of  $D$  in eqn. (11.57) for a single horizontal tube. i.e.

$$h_{\text{horiz\_Ntubes}} = 0.729 \cdot \left[ \frac{\rho_L (\rho_L - \rho_V) \cdot k_L^3 \cdot g \cdot h'_{fg}}{\mu_L \cdot (N \cdot D) \cdot (T_{\text{sat}} - T_s)} \right]^{\frac{1}{4}} \quad W/(m^2 \cdot C) \dots \text{for } 0 < Re_f < 30 \dots (11.60)$$

Clearly, this is related to the value of heat transfer coeff. for a single horizontal tube as follows:

$$h_{\text{horiz\_Ntubes}} = \frac{1}{N^{\frac{1}{4}}} \cdot h_{\text{horiz\_1tube}} \quad \dots (11.61)$$

Chen (1961) has suggested the following modified form of eqn.(11.57) for condensation on a vertical tube bank, to take into account the condensation occurring on the sub-cooled film between two adjacent tubes:

$$h_{\text{horiz\_Ntubes}} = 0.725 \cdot \left[ \frac{\rho_L (\rho_L - \rho_V) \cdot k_L^3 \cdot g \cdot h'_{fg}}{\mu_L \cdot (N \cdot D) \cdot (T_{\text{sat}} - T_s)} \right]^{\frac{1}{4}} \cdot \left[ 1 + 0.2 \cdot \frac{C_{pL} \cdot (T_{\text{sat}} - T_s) \cdot (N - 1)}{h_{fg}} \right] \quad \dots (11.61)$$

**Note that the second square brackets on the RHS, is a correction factor to eqn. (11.60); also note that term inside this square bracket is  $h_{fg}$  and not  $h'_{fg}$ . Eqn. (11.61) is valid for:**

$$\frac{C_{pL} \cdot (T_{\text{sat}} - T_s)}{h_{fg}} \leq 2 \quad \text{and,} \quad Pr_L \geq 1$$

And,

$$\frac{C_p L (T_{sat} - T_s)}{h_{fg}} = Ja = \text{Jacob\_number}$$

**Prob.3.2.1.** Saturated steam at atmospheric pressure condenses on a vertical plate (size: 30 cm × 30 cm) maintained at 60 C. Determine heat transfer rate and the mass of steam condensed per hour.

(b) If the plate is tilted at an angle of 30 deg. to the vertical, what is the value of condensation rate?

**Mathcad Solution:**

In Mathcad we have already written Functions for properties of Sat. water and also for Steam, as functions of temperature.

So, now, in the same worksheet, **let us write Functions for Film condensation of water (i.e. steam) on various geometries, using the equations given above.**

**Input:**  $T_s$ ,  $T_{\text{sat}}$  (C),  $L$ ,  $b$  (m)

**Output:**  $\delta_L$ ,  $h$  ( $\text{W}/\text{m}^2\cdot\text{C}$ ),  $Re_{\text{film}}$ ,  $Q$  (W),  $m_{\text{cond}}$  (kg/s) in a Matrix

**Note:** Take liquid properties at  $T_f = (T_{\text{sat}} + T_s)/2$ , and  $h_{\text{fg}}$  and vap. properties at  $T_{\text{sat}}$ .

Following are the steps:

Line 1: defines the Function on LHS, and gives an error message if  $T_s > T_{\text{sat}}$

Line 2:  $T_f = (T_{\text{sat}} + T_s)/2$  is calculated

Line 3 to 10: Various properties of liquid and vapour are calculated using the property Functions for Sat. water already written

Line 11:  $h_{\text{fg\_prime}}$  is calculated

Line 12: value of  $g$  is entered

Line 13:  $\delta_L$ , the film thickness at a distance  $L$  from top, is calculated

Line 14:  $Re$ , the 'film Reynold's No.' is calculated

Line 15: If  $Re < 30$ , it is pure laminar film condensation, and  $h_{\text{vert}}$  (i.e. average heat tr. coeff.) is calculated as per the formula shown

Line 16, 17, 18: If  $30 < Re \leq 1800$ , it is 'laminar-wavy' film, and now, the  $h_{\text{vert}}$  and the new  $Re_f$  are calculated as per the calculation formulas

Line 19, 20, 21: If  $Re > 1800$ , it is 'turbulent' film, and now,  $h_{\text{vert}}$  and the new  $Re_f$  are calculated again as per the calculation formulas

Line 22: heat transfer,  $Q$  is calculated as:  $Q = h_{\text{vert}} * (L * b) * (T_{\text{sat}} - T_s)$

Line 23: mass of steam condensed is calculated

Line 24: AA is defined as a Matrix of 2 rows and 5 columns, first row being the column headings and the second row giving values of  $\delta_L$ ,  $h_{\text{vert}}$ ,  $Re_f$ ,  $Q$  and  $m_{\text{condensed}}$ .

Line 25: returns this Matrix as the output of the Function.

See the Function below:

```

FilmCondensation_Steam_VertPlate(Ts, Tsat, L, b) := return "Ts must be less than Tsat !" if Ts - Tsat ≥ 0
Tf ←  $\frac{T_s + T_{sat}}{2}$ 
rhoL ←  $\frac{1}{vf\_H2O(TempK, H2Ov\_f, T_f + 273.15)}$ 
rhov ←  $\frac{1}{vg\_H2O(TempK, H2Ov\_g, T_{sat} + 273.15)}$ 
hfg ← hfg\_H2O(TempK, H2Ohfg, Tsat + 273.15)

kL ← kf\_H2O(TempK, H2Okf, Tf + 273.15)
cpL ← cpf\_H2O(TempK, H2Ocpf, Tf + 273.15)
PrL ← Prf\_H2O(TempK, H2OPrf, Tf + 273.15)
vL ←  $\frac{\mu_L}{\rho_L}$ 
hfg_prime ← hfg + 0.68·cpL·(Tsat - Ts)
g ← 9.81
deltaL ←  $\left[ \frac{4 \cdot \mu_L \cdot k_L \cdot (T_{sat} - T_s) \cdot L}{g \cdot \rho_L \cdot (\rho_L - \rho_v) \cdot h_{fg\_prime}} \right]^{\frac{1}{4}}$ 
Re ←  $\frac{4 \cdot g \cdot \rho_L \cdot (\rho_L - \rho_v) \cdot \delta_L^3}{3 \cdot \mu_L^2}$ 
hvert ← 1.47·Re $\frac{-1}{3}$ ·kL· $\left(\frac{g}{v_L^2}\right)^{\frac{1}{3}}$  if 0 < Re ≤ 30
if 30 < Re ≤ 1800
    hvert ←  $\frac{Re \cdot k_L}{1.08 \cdot Re^{1.22} - 5.2} \cdot \left(\frac{g}{v_L^2}\right)^{\frac{1}{3}}$ 
    Ref ←  $\left[ 4.81 + \frac{3.7 \cdot L \cdot k_L \cdot (T_{sat} - T_s)}{\mu_L \cdot h_{fg\_prime}} \cdot \left(\frac{g}{v_L^2}\right)^{\frac{1}{3}} \right]^{0.82}$ 
if Re > 1800
    hvert ←  $\frac{Re \cdot k_L}{8750 + 58 \cdot Pr_L^{0.5} \cdot (Re^{0.75} - 253)} \cdot \left(\frac{g}{v_L^2}\right)^{\frac{1}{3}}$ 
    Ref ←  $\left[ \frac{0.069 \cdot L \cdot k_L \cdot Pr_L^{0.5} \cdot (T_{sat} - T_s)}{\mu_L \cdot h_{fg\_prime}} \cdot \left(\frac{g}{v_L^2}\right)^{\frac{1}{3}} - 151 \cdot Pr_L^{0.5} + 253 \right]^{\frac{4}{3}}$ 
Q ← hvert·(L·b)·(Tsat - Ts)
mcondensed ←  $\frac{Q}{h_{fg\_prime}}$ 
AA ←  $\left( \begin{array}{ccccc} \text{"delta\_L(m)"} & \text{"h\_avg(W/m^2.C)"} & \text{"Re\_f"} & \text{"Q (W)"} & \text{"m\_cond (kg/s)"} \\ \text{delta\_L} & h_{vert} & Re_f & Q & m_{condensed} \end{array} \right)$ 
AA

```

Now, let us use this Function to get results for the above problem:

Data:

$$T_s := 60 \quad T_{sat} := 100 \quad L := 0.3 \quad b := 0.3$$

$$\text{FilmCondensation\_Steam\_VertPlate}(T_s, T_{sat}, L, b) = \left( \begin{array}{ccccc} \text{"delta\_L(m)"} & \text{"h\_avg(W/m^2.C)"} & \text{"Re\_f"} & \text{"Q (W)"} & \text{"m\_cond (kg/s)"} \\ 1.506 \times 10^{-4} & 7.28 \times 10^3 & 404.868 & 2.621 \times 10^4 & 0.011 \end{array} \right)$$

Immediately, we see that:

**heat transfer rate,  $Q = 26210 \text{ W} \dots \text{ Ans.}$**

**steam condensed =  $0.011 \text{ kg/s} = 39.6 \text{ kg/h} \dots \text{ Ans.}$**

In addition, note the value of thickness of film at the bottom of the plate (i.e. at  $x = L$ ), and  $h_{\text{vert}}$  and  $Re_f$ . Since  $Re_f$  is between 30 and 1800, it is 'laminar-wavy' region.

**(b) If the plate is tilted at an angle of 30 deg. to the vertical, what is the value of condensation rate?**

Now, eqns for vertical plate are used, but  $h_{inclined} = h_{vert} * (\cos(\theta))^{1/4}$  where  $\theta$  (deg.) is the inclination of the plate to the vertical.

Following is the Mathcad Function for an Inclined plate, inclined at  $\theta$  degrees to vertical:

**Mathcad Function to find  $h_{vert}$  for Film condensation of steam on an Inclined plate, inclined at theta deg to the vertical:**

**Input:**  $T_s$ ,  $T_{sat}$  (C),  $L$ ,  $b$  (m),  $\theta$  (deg.)

**Output:**  $h_{film}$  (W/m<sup>2</sup>.C)

**Note:** Take liquid properties at  $T_f = (T_{sat} + T_s)/2$ , and  $h_{fg}$  and vap. properties at  $T_{sat}$ .

```
FilmCondensation_Steam_InclinedVPlate_h(Ts, Tsat, L, b, theta) :=
| return "Ts must be less than Tsat !" if Ts - Tsat ≥ 0
| AA ← FilmCondensation_Steam_VertPlate(Ts, Tsat, L, b)
| hvert ← AA1,1
| theta_rad ←  $\frac{\theta \cdot \pi}{180}$ 
| hinclined ← hvert · (cos(theta_rad)) $\frac{1}{4}$ 
| hinclined
```

In the above program, we have:

Line 1: defines the Function on LHS, and gives an error message if  $T_s > T_{sat}$

Line 2: Mathcad Function written above for a vertical plate is invoked, and the resulting Matrix is assigned to AA

Line 3:  $h_{vert}$  is reads off from the Matrix. Remember that result of the Function is a  $2 \times 5$  Matrix. In Mathcad, by default, rows and columns are *numbered starting from zero* (not 1, which is usual). So, note that  ***$h_{vet}$  is the element AA is the element in the first row, first column as per this notation.***

Line 4: theta is converted to radians since in Mathcad arguments to trigonometric functions should be in Radians.

Line 5:  $h_{inclined}$  is calculated

Line 6: value of  $h_{inclined}$  is returned as the output of this Mathcad Function

Now, applying the above Function for this problem:

When the plate is inclined at 30 deg. to vertical:

$$T_s := 60 \text{ C} \quad T_{\text{sat}} := 100 \text{ C} \quad L := 0.3 \text{ m} \quad b := 0.3 \text{ m} \quad \text{theta} := 30 \text{ deg.}$$

$$\text{FilmCondensation\_Steam\_InclinedVPlate\_h}(T_s, T_{\text{sat}}, L, b, \text{theta}) = 7.023 \times 10^3 \text{ W/m}^2\text{.C}$$

Therefore:  $Q := 7023 \cdot (0.3 \cdot 0.3) \cdot (T_{\text{sat}} - T_s)$

i.e.  $Q = 2.528 \times 10^4 \text{ W}$

and,  $m_{\text{cond}} := \frac{Q}{2257 \cdot 10^3}$

i.e.  $m_{\text{cond}} = 0.0112 \text{ kg/s}$

**Prob.3.2.2.** Saturated steam at 80 C condenses as a film on a vertical plate maintained at 70 C. Calculate the average heat transfer coeff. and the rate of condensation. [VTU – M.Tech. – June/July 2009]

**Mathcad Solution:**

Apply the Function written above directly:

$$T_s := 70 \text{ C} \quad T_{\text{sat}} := 80 \text{ C} \quad L := 1 \text{ m} \quad b := 1 \text{ m}$$

$$\text{FilmCondensation\_Steam\_VertPlate}(T_s, T_{\text{sat}}, L, b) = \left( \begin{array}{ccccc} \text{"delta\_L(m)"} & \text{"h\_avg(W/m}^2\text{.C)"} & \text{"Re\_f"} & \text{"Q (W)"} & \text{"m\_cond (kg/s)"} \\ 1.463 \times 10^{-4} & 7.305 \times 10^3 & 323.82 & 7.305 \times 10^4 & 0.031 \end{array} \right)$$

**Note:** Since the size of plate is not given, we have assumed it to be 1 m × 1 m.

**Thus,  $h_{\text{avg}} = 7305 \text{ W/m}^2\text{.C}$ , and  $m_{\text{cond}} = 0.031 \text{ kg/s per m}^2 \text{ area} \dots \text{Ans.}$**

**Prob.3.2.3.** A vertical plate, 500 mm high and 200 mm wide is to be used to condense sat. steam at 1 atm. (a) At what surface temp must the plate be maintained to achieve a condensation rate of 25 kg/h?

(b) compute and plot the surface temp as a function of condensation rate for  $15 < m_{\text{cond}} < 50 \text{ kg/h}$

(Ref: 3)

**Mathcad Solution:**

We shall use the Mathcad Function already written for a vertical plate, and apply ‘Solve block’ of Mathcad to find  $T_s$  to get the desired condensation rate:

Following is the worksheet:

First, assume a value for  $T_s$  and do the calculations using the Mathcad Function written earlier for a vertical plate:

Data:

$$T_s := 60 \text{ C} \dots \text{assumed value}$$

$$T_{sat} := 100 \text{ C} \quad L := 0.5 \text{ m} \quad b := 0.2 \text{ m}$$

$$\text{FilmCondensation\_Steam\_VertPlate}(T_s, T_{sat}, L, b) = \begin{pmatrix} \text{"delta\_L(m)"} & \text{"h\_avg(W/m^2.C)"} & \text{"Re\_f"} & \text{"Q (W)"} & \text{"m\_cond (kg/s)"} \\ 1.711 \times 10^{-4} & 6.682 \times 10^3 & 614.859 & 2.673 \times 10^4 & 0.011 \end{pmatrix}$$

Now,  $m\_cond$  is the element (1,4) in the Matrix above. (Remember: numbering of rows and columns starts from zero in Mathcad).

**OLIVER WYMAN**

Oliver Wyman is a leading global management consulting firm that combines deep industry knowledge with specialized expertise in strategy, operations, risk management, organizational transformation, and leadership development. With offices in 50+ cities across 25 countries, Oliver Wyman works with the CEOs and executive teams of Global 1000 companies.  
An equal opportunity employer.

**MARSH & MCLENNAN COMPANIES**

So, let us apply the ‘Solve Block’ of Mathcad to get the value of  $T_s$  such that  $m_{\text{cond}}$  will be 25 kg/h = (25/3600) kg/s:

$$m_{\text{cond}} := 25 \text{ kg/h} \dots \text{required as per data}$$

Given

$$\text{FilmCondensation\_Steam\_VertPlate}(T_s, T_{\text{sat}}, L, b)_{1,4} = \frac{m_{\text{cond}}}{3600}$$

$$T_s(m_{\text{cond}}) := \text{Find}(T_s)$$

Note that we have written the result of Solve Block, viz.  $T_s$  as a function of  $M_{\text{cond}}$  so that we can easily draw the plot of  $T_s$  vs  $m_{\text{cond}}$  later:

We get:

Therefore:

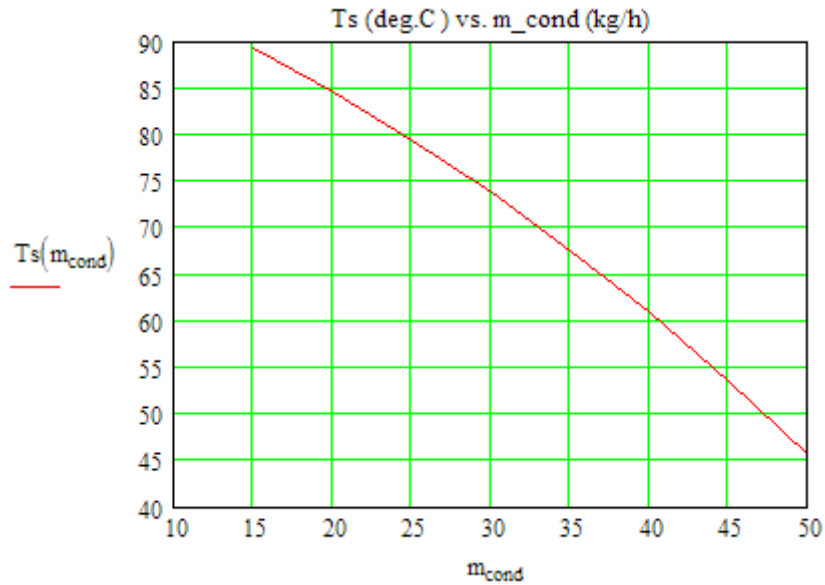

$$T_s(m_{\text{cond}}) = 79.36 \quad \text{C....Ans.}$$

i.e. Value of surface temp required to get a condensation rate of 25 kg/h is 79.36 deg. C ... Ans.

Now, plot  $T_s$  vs  $m_{\text{cond}}$ :

$m_{\text{cond}} := 15, 20..50$  ....define  $m_{\text{cond}}$  as a range variable from 15 to 50 kg/h

$m_{\text{cond}} =$	$T_s(m_{\text{cond}}) =$
15	89.278
20	84.55
25	79.36
30	73.71
35	67.555
40	60.825
45	53.408
50	45.424

=====  
**Prob.3.2.4.** A vertical plate, 2.5 m high, maintained at a uniform temp of 54 C, is exposed to sat. steam at atm. pressure.

- a) Estimate the condensation and heat transfer rates per unit width of the plate
- b) If the plate height were halved, would turbulent flow still exist?
- c) For  $54 < T_s < 90$  C, plot the condensation rate as a function of plate temp for the two plate heights of parts (a) and (b). (Ref: 3)

**Mathcad Solution:**

We shall use the Mathcad Function already written for a vertical plate.

Following is the worksheet:

```

Data:

Ts := 54 C....
Tsat := 100 C    L := 2.5 m    b := 1 m

FilmCondensation_Steam_VertPlate(Ts, Tsat, 2.5, b) = (
    "delta L(m)"    "h_avg(W/m^2.C)"    "Re f"    "Q (W)"    "m_cond (kg/s)"
    2.665 x 10^-4    4.925 x 10^3    2.433 x 10^3    5.664 x 10^5    0.237
)
    
```

We observe that:

$Re_f = 2433 > 1800$ ...Therefore, it is turb. flow.

Heat transfer,  $Q = 5.664E05$  W ....Ans.

Condensation rate,  $m_{cond} = 0.237$  kg/s .... Ans.

(b) When the vertical height is halved, i.e.  $L = 1.25$  m, we have:

$$\text{FilmCondensation\_Steam\_VertPlate}(T_s, T_{sat}, 1.25, b) = \left( \begin{array}{cc|cc} \text{"delta L(m)"} & \text{"h avg(W/m^2.C)"} & \text{"Re f"} & \text{"Q (W)"} \\ \hline 2.241 \times 10^{-4} & 5.524 \times 10^3 & 1.379 \times 10^3 & 3.176 \times 10^5 \end{array} \right) \begin{array}{c} \text{"m cond (kg/s)"} \\ 0.133 \end{array}$$

We see that:

$Re_f = 1379$  . i.e.  $30 < Re_f < 1800$  ... Therefore, it is *not turb. film*, but *wavy laminar film*.....Ans.

(c) Plot the condensation rate as a function of plate temp, for plate heights  $L = 2.5$  m and  $L = 1.25$  m:

**For L = 2.5 m:**

Note that in the output of the Mathcad Function,  $m_{\text{cond}}$  is element (1,4) i.e. element in the first row, 4<sup>th</sup> column. Remember that numbering of rows and columns starts from zero in Mathcad, by default.

$T_s := 54, 60..90$  C .... define a range variable for  $T_s$

For this range of  $T_s$ ,  $m_{\text{cond}}$  is given as:

$T_s =$	$\text{FilmCondensation\_Steam\_VertPlate}(T_s, T_{\text{sat}}, L, b)_{1,4}$
54	0.262
60	0.231
66	0.2
72	0.167
78	0.139
84	0.109
90	0.075

**Now, for L = 1.25 m:**

Take the same variation of  $T_s$  as earlier, i.e.

$T_{s2} := 54, 60..90$  C .... define a range variable for  $T_s$

And, the corresponding values of  $m_{\text{cond}}$  are:

$T_{s2} =$	$\text{FilmCondensation\_Steam\_VertPlate}(T_{s2}, T_{\text{sat}}, 1.25, b)_{1,4}$
54	0.133
60	0.121
66	0.108
72	0.094
78	0.078
84	0.061
90	0.042

Now, plot the variation of  $m_{cond}$  against  $T_s$  for both the plates, on the same graph:

=====

**Mathcad Function to find  $h_{vert}$  etc. for Film condensation of steam on a vertical cylinder:**

**Input:**  $T_s$ ,  $T_{sat}$  (C), L, D (m)

**Output:**  $\delta_{L, h}$  (W/m<sup>2</sup>.C),  $Re_{film}$ , Q (W),  $m_{cond}$  (kg/s) in a Matrix

When  $D \gg \delta_{L, h}$ , eqns for vertical plate can be used for vertical cylinder too.

Let us write a Mathcad Function to calculate various parameters for this case.

```
FilmCondensation_Steam_VertCyl(Ts, Tsat, L, D) :=
return "Ts must be less than Tsat !" if Ts - Tsat ≥ 0

Tf ←  $\frac{T_s + T_{sat}}{2}$ 
rhoL ←  $\frac{1}{v_{f\_H2O}(TempK, H2Ov\_f, T_f + 273.15)}$ 
rhoV ←  $\frac{1}{v_{g\_H2O}(TempK, H2Ov\_g, T_{sat} + 273.15)}$ 
hfg ← hfg\_H2O(TempK, H2Ohfg, Tsat + 273.15)
muL ← muf\_H2O(TempK, H2Omuf, Tf + 273.15)
kL ← kf\_H2O(TempK, H2Okf, Tf + 273.15)
cpL ← cpf\_H2O(TempK, H2Ocpf, Tf + 273.15)
PrL ← Prf\_H2O(TempK, H2OPrf, Tf + 273.15)

vL ←  $\frac{\mu_L}{\rho_L}$ 
hfg_prime ← hfg + 0.68·cpL·(Tsat - Ts)
g ← 9.81

deltaL ←  $\left[ \frac{4 \cdot \mu_L \cdot k_L \cdot (T_{sat} - T_s) \cdot L}{g \cdot \rho_L \cdot (\rho_L - \rho_V) \cdot h_{fg\_prime}} \right]^{\frac{1}{4}}$ 
Re ←  $\frac{4 \cdot g \cdot \rho_L \cdot (\rho_L - \rho_V) \cdot \delta_L^3}{3 \cdot \mu_L^2}$ 

hvert ←  $1.47 \cdot Re^{\frac{-1}{3}} \cdot k_L \cdot \left( \frac{g}{v_L} \right)^{\frac{1}{3}}$  if 0 < Re ≤ 30
if 30 < Re ≤ 1800
| hvert ←  $\frac{Re \cdot k_L}{1.08 \cdot Re^{1.22} - 5.2} \cdot \left( \frac{g}{v_L} \right)^{\frac{1}{3}}$ 
| Ref ←  $\left[ 4.81 + \frac{3.7 \cdot L \cdot k_L \cdot (T_{sat} - T_s)}{\mu_L \cdot h_{fg\_prime}} \cdot \left( \frac{g}{v_L} \right)^{\frac{1}{3}} \right]^{0.82}$ 
if Re > 1800
| hvert ←  $\frac{Re \cdot k_L}{8750 + 58 \cdot Pr_L - 0.5 \cdot (Re^{0.75} - 253)} \cdot \left( \frac{g}{v_L} \right)^{\frac{1}{3}}$ 
| Ref ←  $\left[ \frac{0.069 \cdot L \cdot k_L \cdot Pr_L^{0.5} \cdot (T_{sat} - T_s)}{\mu_L \cdot h_{fg\_prime}} \cdot \left( \frac{g}{v_L} \right)^{\frac{1}{3}} - 151 \cdot Pr_L^{0.5} + 253 \right]^{\frac{4}{3}}$ 
Q ← hvert·(L·π·D)·(Tsat - Ts)
mcondensed ←  $\frac{Q}{h_{fg\_prime}}$ 
AA ← ( "delta_L(m)" "h_avg(W/m^2.C)" "Re_f" "Q (W)" "m_cond (kg/s)" )
      ( delta_L hvert Ref Q mcondensed )
AA
```

**Note:** Above program for vertical cylinder is similar to the one for vertical plate written earlier, except that now, heat transfer area is  $A_s = (\pi.D.L)$ . Then heat transferred,  $Q$  and  $m_{cond}$  are calculated as earlier. Study the program shown above.

**Prob.3.2.5.** Consider a vertical tube, 1 m high, 80 mm dia, maintained at a uniform temp of 50 C, exposed to sat. steam at atm. pressure. Find out the heat transfer and steam condensation rate.

**Mathcad Solution:**

Let us use the Mathcad Function for condensation on a vertical cylinder, written above:

Data:

$$T_s := 50 \text{ C} \quad T_{sat} := 100 \text{ C} \quad L := 1 \text{ m} \quad D := 0.08 \text{ m}$$

$$\text{FilmCondensation\_Steam\_VertCyl}(T_s, T_{sat}, L, D) = \begin{pmatrix} \text{"delta\_L(m)"} & \text{"h\_avg(W/m^2.C)"} & \text{"Re\_f"} & \text{"Q (W)"} & \text{"m\_cond (kg/s)"} \\ 2.1742 \times 10^{-4} & 5.6045 \times 10^3 & 1.1828 \times 10^3 & 7.0428 \times 10^4 & 0.0294 \end{pmatrix}$$

In the past four years we have drilled  
**81,000 km**  
 That's more than **twice** around the world.

**Who are we?**  
 We are the world's leading oilfield services company. Working globally—often in remote and challenging locations—we invent, design, engineer, manufacture, apply, and maintain technology to help customers find and produce oil and gas safely.

**Who are we looking for?**  
 We offer countless opportunities in the following domains:

- Engineering, Research, and Operations
- Geoscience and Petrotechnical
- Commercial and Business

**What will you be?**

**Schlumberger**

careers.slb.com

We see that:

$Re_f = 1182.8$  i.e.  $30 < Re_f < 1800$ , so it is 'laminar-wavy' film region.

Heat transfer rate,  $Q = 70428 \text{ W} \dots$  Ans.

Condensation rate,  $m_{cond} = 0.0294 \text{ kg/s} \dots$  Ans.

Plot  $m_{cond}$  against  $T_s$  for  $20 < T_s < 50 \text{ C}$ :

$T_s := 20, 25..50 \text{ C}$  ... define a range variable for  $T_s$

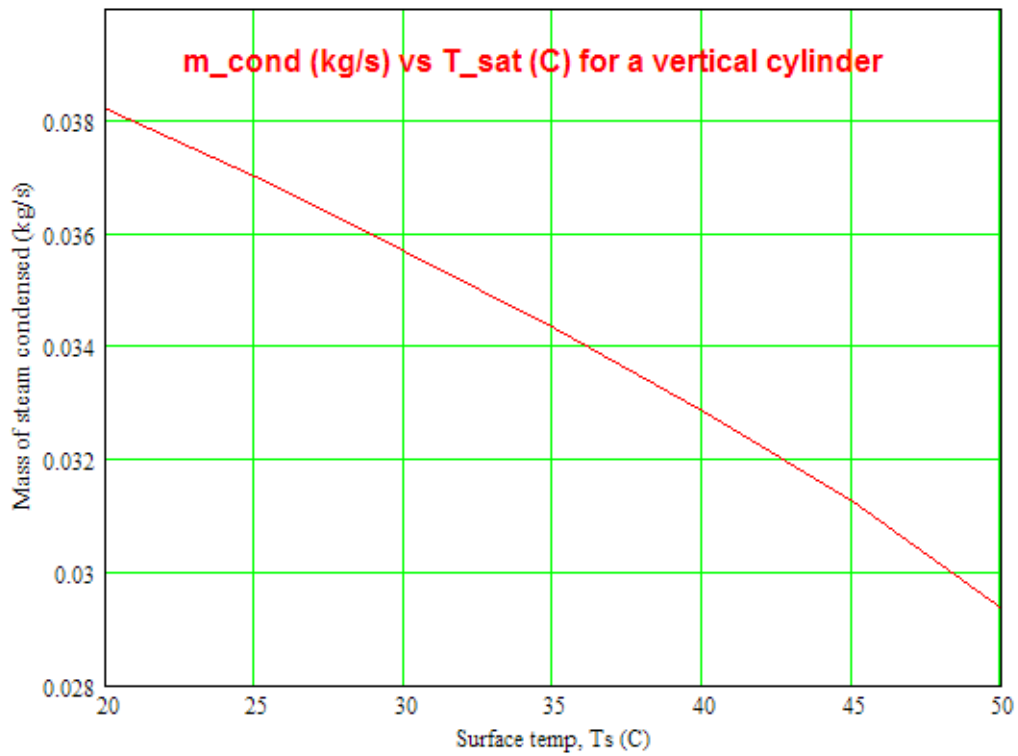

Note that  $m_{cond}$  is element (1,4) in the output Matrix of the above Function.

*Remember that numbering of rows and columns starts from zero in Mathcad, by default.*

Then, we have:

$T_s =$	$\text{FilmCondensation\_Steam\_VertCyl}(T_s, T_{sat}, L, D)_{1,4}$
20	0.038
25	0.037
30	0.036
35	0.034
40	0.033
45	0.031
50	0.029

And, plot the results:

Could it be   
Unilever

**Prob.3.2.6.** Dry, sat. steam at a pressure of 2.45 bar condenses on the surface of a vertical tube of 40 mm dia and height 1 m. Tube surface temp is 117 C. Estimate the thickness of the condensate film and local heat transfer coeff. at a distance of 0.2 m from the upper end of the tube. [VTU – M.Tech. – Dec. 2010]

**Mathcad Solution:**

At 2.45 bar, sat. temp. of water is:  $T_{sat} = 126.75 \text{ deg.C}$ .  $T_s$  is given as 117 C.

Let us use the Mathcad Function for condensation on a vertical cylinder, written above:

We get:

Data:

$$T_s := 117 \text{ C} \quad T_{sat} := 126.75 \text{ C} \quad L := 0.2 \text{ m} \quad D := 0.04 \text{ m}$$

$\text{FilmCondensation\_Steam\_VertCyl}(T_s, T_{sat}, L, D) = \begin{pmatrix} \text{"delta\_L(m)"} & \text{"h\_avg(W/m^2.C)"} & \text{"Re\_f"} & \text{"Q (W)"} & \text{"m\_cond (kg/s)"} \\ 8.929 \times 10^{-5} & 1.1612 \times 10^4 & 175.9457 & 2.8456 \times 10^3 & 1.2867 \times 10^{-3} \end{pmatrix}$
--

Thus:

**Thickness of film at  $x = 0.2 \text{ m} = \text{delta\_L} = 0.0893 \text{ mm} \dots \text{Ans.}$**

**Avg. heat transfer coeff =  $11341 \text{ W/m}^2.\text{C}$**

Therefore, local heat transfer coeff is obtained from:  $h_{avg} = (4/3).h_x$

**i.e.  $h_x = h_{avg} \cdot (3/4) = 8506 \text{ W/m}^2.\text{C} \dots \text{Ans.}$**

=====

**Prob.3.2.7.** A horizontal tube, 3 cm in dia has its surface temp maintained at 30 C. Steam at 7.38 kPa pressure condenses over it. Determine the rate of heat transfer and the rate of condensation per unit length of the tube.

**Mathcad Solution:**

Let us write a Mathcad Function for condensation of steam on horizontal pipe, using the equation given in the beginning of the Chapter:

.....

**Mathcad Function to find  $h_{\text{horizl}}$ ,  $Q$  and  $m$  for Film condensation of steam on a horizontal cylinder:**

**Input:**  $T_s$ ,  $T_{\text{sat}}$  (C),  $D$  (m)

**Output:**  $h$  ( $\text{W}/\text{m}^2\cdot\text{C}$ ),  $Q$  (W),  $m_{\text{condensed}}$  (kg/s)

**Note:** Take liquid properties at  $T_f = (T_{\text{sat}} + T_s)/2$ , and  $h_{\text{fg}}$  and vap. properties at  $T_{\text{sat}}$ .

```
FilmCondensation_Steam_HorizlCyl_hQm(Ts, Tsat, D, L) :=
return "Ts must be less than Tsat !" if Ts - Tsat ≥ 0
Tf ← (Ts + Tsat) / 2
rhoL ← 1 / (vf_H2O(TempK, H2Ov_f, Tf + 273.15))
rhov ← 1 / (vg_H2O(TempK, H2Ov_g, Tsat + 273.15))
hfg ← h_fg_H2O(TempK, H2Oh_fg, Tsat + 273.15)
muL ← mu_f_H2O(TempK, H2Omu_f, Tf + 273.15)
kL ← k_f_H2O(TempK, H2Ok_f, Tf + 273.15)
cpL ← cp_f_H2O(TempK, H2Ocp_f, Tf + 273.15)
hfg_prime ← hfg + 0.68 cpL · (Tsat - Ts)
g ← 9.81
hhorizl ← 0.729 [ (g · rhoL · (rhoL - rhov) · hfg_prime · kL3) / (muL · (Tsat - Ts) · D) ]1/4
As ← π · D · L
Q ← hhorizl · As · (Tsat - Ts)
mcond ← Q / hfg_prime
( "h (W/m^2.C)" "Q (W)" "m_cond (kg/s)" )
( hhorizl Q mcond )
```

In the above program:

Line 1: defines the Function on LHS, and gives an error message if  $T_s > T_{\text{sat}}$

Line 2:  $T_f = (T_{\text{sat}} + T_s)/2$  is calculated

Line 3 to 8: Various properties of liquid and vapour are calculated using the property Functions for Sat. water already written.

Line 9: Modified heat of evaporation,  $h_{fg\_prime}$  is calculated here

Line 10: value of  $g$  is entered

Line 11: Average heat tr. coeff.  $h_{horizl}$  is calculated

Line 12: Surface area  $A_s$  is calculated

Line 13: Heat transferred,  $Q$  is calculated

Line 14: Mass of steam condensed,  $m_{cond}$  is calculated as:  $m_{cond} = (Q / h_{fg\_prime})$

Line 15: Output of the Function is a  $(2 \times 5)$  Matrix. Its first row contains headings, and second row contains values of  $h_{horizl}$  ( $W/m^2.C$ ),  $Q$  ( $W$ ) and  $m_{cond}$  ( $kg/s$ ) respectively.

---

Now, let us solve the above problem using this Function for horizl cylinder:

At 7.38 kPa, the sat. temp of water is:  $T_{sat} = 40$  C, and  $T_s$  is given as 30 C.

Click on the ad to read more

Following is the Mathcad worksheet:

**Data:**

$$T_s := 30 \text{ C} \quad T_{\text{sat}} := 40 \text{ C} \quad L := 1 \text{ m} \quad D := 0.03 \text{ m}$$

$$\text{FilmCondensation\_Steam\_HorizlCyl\_hQm}(T_s, T_{\text{sat}}, D, L) = \left( \begin{array}{l} \text{"h (W/m}^2\text{.C"} \quad \text{"Q (W)} \quad \text{"m\_cond (kg/s)} \\ 9.308 \times 10^3 \quad 8.773 \times 10^3 \quad 3.603 \times 10^{-3} \end{array} \right)$$

**Thus:**

Heat transfer coeff. =  $h_{\text{horizl}} = 9308 \text{ W/m}^2\text{.C} \dots \text{Ans.}$

Heat transferred,  $Q = 8773 \text{ W} \dots \text{Ans.}$

Steam condensed =  $m_{\text{cond}} = 0.003603 \text{ kg/s} \dots \text{Ans.}$

=====

**Prob.3.2.8.** A horizontal tube, 1 m long has its surface temp maintained at 70 C. Sat. steam at 1 atm pressure condenses over it. (a) What is the diameter required to achieve a condensation rate of 125 kg/h? (b) Plot the condensation rate as a function of surface temp for  $T_s$  between 70 and 90 C and for diameters of 125, 150 and 175 mm.(Ref. 3)

**Mathcad Solution:**

First, we shall assume a value for dia, D and then use the Mathcad Function for condensation od steam over horizl cylinders, written above. Then, we will use the ‘Solve Block’ of Mathcad to get the required dia to achieve 125 kg/h of condensation rate.

Following is the Mathcad worksheet:

**Data:**

$$T_s := 70 \text{ C} \quad T_{\text{sat}} := 100 \text{ C} \quad L := 1 \text{ m}$$

$D := 0.03 \text{ m} \dots \text{Assumed value}$

$$\text{FilmCondensation\_Steam\_HorizlCyl\_hQm}(T_s, T_{\text{sat}}, D, L) = \left( \begin{array}{l} \text{"h (W/m}^2\text{.C"} \quad \text{"Q (W)} \quad \text{"m\_cond (kg/s)} \\ 8.8816 \times 10^3 \quad 2.5112 \times 10^4 \quad 0.0107 \end{array} \right)$$

We see that with assumed value of  $D = 0.03 \text{ m}$ , we have  $m_{\text{cond}} = 0.0107 \text{ kg/s}$

But, we need  $m_{\text{cond}} = 125 \text{ kg/h}$ .

Let us use 'Solve Block' of Mathcad:

Note that in the output Matrix,  $m_{\text{cond}}$  is element (1,2) of the Matrix.

**Remember that numbering of rows and columns starts from zero in Mathcad, by default.**

$m_{\text{cond}} := 125 \text{ kg/h ... from data}$

Given

$$\text{FilmCondensation\_Steam\_HorizlCyl\_hQm}(T_s, T_{\text{sat}}, D, L)_{1,2} = \frac{125}{3600}$$

$D := \text{Find}(D)$

$D = 0.144$

**m.... dia required to get 125 kg/h condensation.....Ans.**

**Plot  $m_{\text{cond}}$  as a function of  $T_s$  for various diameters:**

$T_s := 70, 72.. 90 \quad C \dots$  define  $T_s$  as a range variable

**For  $D = 0.125 \text{ m}$ :**

$T_s =$	$\text{FilmCondensation\_Steam\_HorizlCyl\_hQm}(T_s, T_{\text{sat}}, 0.125, L)_{1,2}$

**Plot the results:**

=====

**Prob.3.2.9.** A horizontal tube, 1 m long has its surface temp maintained at 34 C. Sat. steam at 0.2 bar condenses over it. Determine the heat transfer rate and condensation rate.

**Mathcad Solution:**

At 0.2 bar, we have:  $T_{\text{sat}} = 60 \text{ C}$ .

Use the Mathcad Function for a horizl cylinder.

Following is the Mathcad worksheet:

**Data:**

$$T_s := 34 \text{ C} \quad T_{\text{sat}} := 60 \text{ C} \quad L := 1 \text{ m} \quad D := 0.05 \text{ m.}$$

$$\text{FilmCondensation\_Steam\_HorizlCyl\_hQm}(T_s, T_{\text{sat}}, D, L) = \begin{pmatrix} \text{"h (W/m^2.C)" & \text{"Q (W)" & \text{"m\_cond (kg/s)" } \\ 6.9336 \times 10^3 & 2.8317 \times 10^4 & 0.0116 \end{pmatrix}$$

**Thus:**

Heat transfer rate,  $Q = 28.317 \text{ kW/m} \dots \text{Ans.}$

Condensation rate,  $m_{\text{cond}} = 0.0116 \text{ kg/s} \dots \text{Ans.}$

=====

Above problem was on condensation on a single, horizontal tube.

But, of **more practical interest** is the condensation on a vertical tier of horizontal tubes.

We come across such a case in heat exchangers, particularly **in steam condensers**.

**Let us write a Mathcad Function for condensation on a vertical tier of horizontal tubes:**

Condensation on a Tube bank: N horizontal tubes in a vertical tier:

**Mathcad Function to find  $h_{\text{horizl}}$ , Q, and m for Film condensation of steam on a vertical tier of N horizontal cylinders:**

**Input:**  $T_s$ ,  $T_{\text{sat}}$  (C), D (m), N

**Output:**  $h$  (W/m<sup>2</sup>.C), het transferred per Tier,  $Q_{\text{Tier}}$  (W/Tier),  $m_{\text{cond}}$  (kg/s) per Tier

**Note:** Take liquid properties at  $T_f = (T_{\text{sat}} + T_s)/2$ , and  $h_{\text{fg}}$  and vap. properties at  $T_{\text{sat}}$ .

```

FilmCondensation_Steam_VertTierCyl_hQm(Ts, T_sat, D, L, N) :=
return "Ts must be less than T_sat !" if Ts - T_sat ≥ 0
Tf ← (Ts + T_sat) / 2
rhoL ← 1 / (vf_H2O(TempK, H2Ov_f, Tf + 273.15))
rhoV ← 1 / (vg_H2O(TempK, H2Ov_g, T_sat + 273.15))
hfg ← h_fg_H2O(TempK, H2O_h_fg, T_sat + 273.15)
muL ← mu_f_H2O(TempK, H2Omu_f, Tf + 273.15)
kL ← k_f_H2O(TempK, H2Ok_f, Tf + 273.15)
cpL ← cp_f_H2O(TempK, H2Ocp_f, Tf + 273.15)
hfg_prime ← hfg + 0.68 · cpL · (T_sat - Ts)
g ← 9.81
hhorizl_N ← 0.729 · [ (g · rhoL · (rhoL - rhoV) · hfg_prime · kL^3) / (muL · (T_sat - Ts) · D · N) ]^(1/4)
As ← N · π · D · L
QTier ← hhorizl_N · As · (T_sat - Ts)
mcond ← QTier / hfg_prime
( ( "h (W/m^2.C)" "Q (W) per Tier" "m_cond (kg/s) per Tier" )
  ( hhorizl_N QTier mcond ) )

```

In the above program:

Line 1: defines the Function on LHS, and gives an error message if  $T_s > T_{sat}$

Line 2:  $T_f = (T_{sat} + T_s)/2$  is calculated

Line 3 to 8: Various properties of liquid and vapour are calculated using the property Functions for Sat. water already written.

Line 9: Modified heat of evaporation,  $h_{fg\_prime}$  is calculated here

Line 10: value of  $g$  is entered

Line 11: Average heat tr. coeff. for the tier,  $h_{horizl\_N}$  is calculated; note that this eqn is similar to that for a single horizl tube, except that now,  $D$  is replaced by  $(N.D)$

Line 12: Surface area  $A_s$  is calculated for the tier (i.e. for  $N$  tubes in the tier)

Line 13: Heat transferred for the tier,  $Q_{Tier}$  is calculated

Engineering the Future – since 1758.  
**MAN Diesel & Turbo**

Line 14: Mass of steam condensed for the N tubes of the tier,  $m_{cond}$  is calculated as:  $m_{cond} =$

$$(Q_{Tier} / h_{fg\_prime})$$

Line 15:  $h$ ,  $Q$  and  $m_{cond}$  are returned in a  $2 \times 3$  Matrix. First row of the matrix gives column headings and the second row gives numerical values of  $h$ ,  $Q$  and  $m_{cond}$  respectively.

**Prob.3.2.10.** Consider a heat exchanger with 20 tubes in a vertical column. Each tube has a dia of 1.5 cm, and is 1 m long. Sat. steam at 50 C condenses on the tubes, which are maintained at a surface temp of 20 C. Determine the average heat transfer coeff and rate of condensation of steam.

**Mathcad Solution:**

Use the Mathcad Function written above.

The worksheet is shown below:

**Data:**

$$T_s := 20 \text{ C} \quad T_{sat} := 50 \text{ C} \quad L := 1 \text{ m} \quad D := 0.015 \text{ m} \quad N := 20$$

$$\text{FilmCondensation\_Steam\_VertTierCy1\_hQm}(T_s, T_{sat}, D, L, N) = \begin{pmatrix} \text{"h (W/m^2.C"} & \text{"Q (W) per Tier"} & \text{"m\_cond (kg/s) per Tier"} \\ 3.99054 \times 10^3 & 1.1283 \times 10^5 & 0.04572 \end{pmatrix}$$

**Thus:**

**Avg. heat transfer coeff.  $h = 3.99 \text{ kW/m}^2\text{.C} \dots \text{Ans.}$**

**Heat transfer,  $Q = 112.83 \text{ kW/Tier} \dots \text{Ans.}$**

**Steam condensed,  $m_{cond} = 0.04572 \text{ kg/s} = 164.592 \text{ kg/h} \dots \text{Ans.}$**

**Prob.3.2.11.** Condenser of a steam Power plant operates at 4.25 kPa. There are 100 horizontal tubes arranged in a  $10 \times 10$  square array. Each tube is 8 m long, 3 cm in dia. Tube surface is at 20 C. Determine: (a) Rate of heat transfer (b) Rate of condensation of steam (Ref. 2)

**Mathcad Solution:**

At 4.25 kPa pressure, we have:  $T_{sat} = 30 \text{ C}$ .

Using the Mathcad Function for N horizontal tubes in a vertical Tier, we get:

Data:

$$T_s := 20 \text{ C} \quad T_{sat} := 30 \text{ C} \quad L := 8 \text{ m} \quad D := 0.03 \text{ m} \quad N := 10$$

$$\text{FilmCondensation\_Steam\_VertTierCyl\_hQm}(T_s, T_{sat}, D, L, N) = \begin{pmatrix} \text{"h (W/m^2.C)" } & \text{"Q (W) per Tier"} & \text{"m\_cond (kg/s) per Tier"} \\ 4.89688 \times 10^3 & 3.69216 \times 10^5 & 0.15016 \end{pmatrix}$$

In the above worksheet, we got Q and m\_cond per Tier.

But, there are 10 Tiers. So, multiplying the above values by 10, we get:

**Heat transferred, Q = 3692.16 kW .... Ans.**

**Steam condensed, m\_cond = 1.5016 kg/s = 5406 kg/h .... Ans.**

Now, if  $T_{sat}$  varies from 30 C to 54 C (corresponding to sat. pressure of 4.246 kPa to 15.02 kPa respectively), plot Q and mcond against  $T_{sat}$ :

$T_{sat} := 30, 32.. 54 \text{ C}$ .....define a range variable for  $T_{sat}$

$T_{sat} =$	$\text{FilmCondensation\_Steam\_VertTierCyl\_hQm}(T_s, T_{sat}, D, L, N)_{1,1} \cdot 10$	....Q for 10 Tiers

# CAREER KICKSTART

An app to keep you in the know

Whether you're a graduate, school leaver or student, it's a difficult time to start your career. So here at RBS, we're providing a helping hand with our new Facebook app. Bringing together the most relevant and useful careers information, we've created a one-stop shop designed to help you get on the career ladder – whatever your level of education, degree subject or work experience.

And it's not just finance-focused either. That's because it's not about us. It's about you. So download the app and you'll get everything you need to know to kickstart your career.

So what are you waiting for?

Click [here](#) to get started.

And, Plot the results:

=====

**Prob.3.2.12.** A square array of 400 tubes, 15 mm OD is used to condense steam at atm. pressure. The tube walls are maintained at 88 C by a coolant flowing through the tubes. Calculate the amount of steam condensed per hour per unit length of tubes. [ VTU – M.Tech. – Dec. 2009–Jan. 2010]

**Mathcad Solution:**

There are totally 400 tubes, in a square array.

Therefore, we have: 20 tubes per Tier, and there are 20 Tiers.

Using the Mathcad Function already written, we get:

**Data:**

$$T_s := 88 \text{ C} \quad T_{sat} := 100 \text{ C} \quad L := 1 \text{ m} \quad D := 0.015 \text{ m} \quad N := 20$$

$$\text{FilmCondensation\_Steam\_VertTierCyl\_hQm}(T_s, T_{sat}, D, L, N) = \left( \begin{array}{l} \text{"h (W/m^2.C"} \quad \text{"Q (W) per Tier"} \quad \text{"m\_cond (kg/s) per Tier"} \\ 6.42254 \times 10^3 \quad 7.26372 \times 10^4 \quad 0.0317 \end{array} \right)$$

**Thus:**

**Steam condensed = m\_cond = 0.0317 kg/s =**

**0.0317·3600 = 114.12 kg/h...Ans.**

**Prob.3.2.13.** Sat. steam at 1.5 bar condenses inside a 75 mm dia horizontal pipe whose surface is maintained at 100 C. Assuming low vapour velocities and film condensation, estimate the heat transfer coeff. and the condensation rate per unit length of the pipe.

**Mathcad Solution:**

Let us first write a Mathcad Function for film condensation inside horizontal pipe using the equations given at the beginning of the Chapter.

**Film condensation inside horizl tubes: Chato's relation:**

**For low vapour velocities, i.e. Re\_vap < 35000: Input:** Ts, Tsat (C), D (m), L (m)

**Input:** Ts, Tsat (C), D (m), L (m)

**Output:** h<sub>internal</sub> (W/m<sup>2</sup>.C), Q (W) and m<sub>cond</sub> (kg/s)

```
FilmCondensation_Steam_InsideHorizlCyl_hQm(Ts,Tsat,D,L) :=
return "Ts must be less than Tsat !" if Ts - Tsat ≥ 0
Tf ← (Ts + Tsat) / 2
rhoL ← 1 / (vf_H2O(TempK,H2Ov_f,Tf + 273.15))
rhoV ← 1 / (vg_H2O(TempK,H2Ov_g,Tsat + 273.15))
hfg ← h_fg_H2O(TempK,H2O_h_fg,Tsat + 273.15)
muL ← mu_f_H2O(TempK,H2Omu_f,Tf + 273.15)
kL ← k_f_H2O(TempK,H2Ok_f,Tf + 273.15)
cpL ← cp_f_H2O(TempK,H2Ocp_f,Tf + 273.15)
g ← 9.81
hfg_star ← hfg + (3/8)·cpL·(Tsat - Ts)
hinternal ← 0.555 · [ (g·rhoL·(rhoL - rhoV)·kL3 / (muL·(Tsat - Ts)·D) · hfg_star ) ]1/4
As ← π·D·L
Q ← hinternal·As·(Tsat - Ts)
mcond ← Q / hfg_star
( " h (W/m^2.C" " Q (W) " "m_cond (kg/s)" )
  hinternal      Q      mcond )
```

In the above program:

Line 1: defines the Function on LHS, and gives an error message if Ts > Tsat

Line 2: Tf = (Tsat + Ts)/2 is calculated

Line 3 to 8: Various properties of liquid and vapour are calculated using the property Functions for Sat. water already written.

Line 9: value of g is entered

Line 10: Modified heat of evaporation, h<sub>fg\_star</sub> is calculated here

Line 11: Average heat tr. coeff., h<sub>internal</sub> is calculated

Line 12: Surface area  $A_s$  is calculated for the tier (i.e. for  $N$  tubes in the tier)

Line 13: Heat transferred,  $Q$  is calculated

Line 14: Mass of steam condensed inside the tube,  $m_{\text{cond}}$  is calculated as:  $m_{\text{cond}} =$

$(Q / h_{\text{fg\_star}})$

Line 15:  $h$ ,  $Q$  and  $m_{\text{cond}}$  are returned in a  $2 \times 3$  Matrix. First row of the matrix gives column headings and the second row gives numerical values of  $h$ ,  $Q$  and  $m_{\text{cond}}$  respectively.

---

Now, let us solve the above problem.

Note that corresponding to a pressure of 1.5 bar, for water:  $T_{\text{sat}} = 111.35 \text{ C}$ .

# ORACLE®

## **Be BRAVE**

### ***enough to reach for the sky***

Oracle's business is information - how to manage it, use it, share it, protect it. Oracle is the name behind most of today's most innovative and successful organisations.

Oracle continuously offers international opportunities to top-level graduates, mainly in our Sales, Consulting and Support teams.

If you want to join a company that will invest in your future, Oracle is the company for you to drive your career!

<https://campus.oracle.com>

# ORACLE®

**ORACLE IS THE INFORMATION COMPANY**

Following is the Mathcad worksheet, wherein the above Mathcad Function is invoked:

**Data:**

$$T_s := 100 \text{ C} \quad T_{\text{sat}} := 111.35 \text{ C} \quad D := 0.075 \text{ m} \quad L := 1 \text{ m}$$

$$\text{FilmCondensation\_Steam\_InsideHorizlCyl\_hQm}(T_s, T_{\text{sat}}, D, L) = \begin{pmatrix} \text{"h (W/m}^2\text{.C)"} & \text{"Q (W)"} & \text{"m\_cond (kg/s)"} \\ 7.21 \times 10^3 & 1.928 \times 10^4 & 8.591 \times 10^{-3} \end{pmatrix}$$

**Thus:**

Heat transfer coeff,  $h = 7210 \text{ W/m}^2\text{.C}$  ..... Ans.

Condensation rate =  $0.008591 \text{ kg/s} = 30.928 \text{ kg/h}$  .... Ans.

**(b) What is the length of tube required for a condensation rate of 50 kg/h?**

**Plot  $m_{\text{cond}}$  against  $L$  for  $m_{\text{cond}}$  varying from 10 to 70 kg/h:**

We will use the 'Solve Block' of Mathcad to easily calculate the value of  $L$  required to get  $m_{\text{cond}} = 50 \text{ kg/h}$ :

$$m_{\text{cond}} := 50 \text{ kg/h}$$

**Given**

$$\text{FilmCondensation\_Steam\_InsideHorizlCyl\_hQm}(T_s, T_{\text{sat}}, D, L)_{1,2} = \frac{m_{\text{cond}}}{3600}$$

$$L(m_{\text{cond}}) := \text{Find}(L)$$

i.e.  $L(m_{\text{cond}}) = 1.617$  m....length of tube required to get a condensation rate of 50 kg/h .... Ans.

**Note:** In the above,  $L$  is written as function of  $m_{cond}$ . It is useful to draw the plot of  $L$  against  $m_{cond}$ , as shown below:

**To plot the results:**

Use the function  $L(m_{cond})$  to get values of  $L$  for different values of  $m_{cond}$ :

$m_{cond} := 10, 15.. 70$  kg/h.....define a range variable for  $m_{cond}$

$m_{cond} =$	$L(m_{cond}) =$
10	0.323
15	0.485
20	0.647
25	0.808
30	0.97
35	1.132
40	1.293
45	1.455
50	1.617
55	1.778
60	1.94
65	2.102
70	2.263

=====

**EES Procedures for Condensation heat transfer:**

EES has the advantage that it has built-in Functions for properties of a large number of Fluids and materials.

So, it is very convenient to write Functions/Procedures for complicated equations, particularly if properties have to be calculated many times.

**We present below a few Procedures for condensation of steam on a few geometries:**

-----  
\$UnitSystem SI Pa C J

PROCEDURE condensation\_VP\_Fluid(Fluid\$,T\_sat, T\_s, b, L: delta\_l, h\_avg, Re\_f, Q, m\_condensed)

“Condensation of any Fluid at T\_sat on a vertical Plate (VP) held at T\_s:”

“For Fluid\$, use any of the many Fluids for which Data is available in EES.

In the calling program, add a line: Fluid\$ = ‘Steam\_IAPWS’, or ‘Water’, or ‘Ammonia’, or ‘R12’, or ‘R22’ etc. etc.”

### Masters in Management

Designed for high-achieving graduates across all disciplines, London Business School’s Masters in Management provides specific and tangible foundations for a successful career in business.

This 12-month, full-time programme is a business qualification with impact. In 2010, our MiM employment rate was 95% within 3 months of graduation\*; the majority of graduates choosing to work in consulting or financial services.

As well as a renowned qualification from a world-class business school, you also gain access to the School’s network of more than 34,000 global alumni – a community that offers support and opportunities throughout your career.

For more information visit [www.london.edu/mm](http://www.london.edu/mm), email [mim@london.edu](mailto:mim@london.edu) or give us a call on +44 (0)20 7000 7573.

**Now, let us solve a few problems using these EES Procedures:**

**Prob. 3.2.14.** Sat. steam at atm pressure condenses on a 2 m high, 3 m wide vertical plate maintained at 80 C. Determine the avg heat transfer coeff., rate of heat transfer and the rate of condensation.

(b) If the plate is inclined to vertical at 30 deg. what will be these value s?

(c) For the case (a) draw the variation of condensation rate against  $T_s$  for  $50 < T_s < 90$  C.

**EES Solution:**

$T_{sat} = 100$  C since pressure is 1 atm.

Use the EES Procedure written above.

We have:

“Data:”

$$T_{\text{sat}} = 100 \text{ [C]}$$

$$T_s = 80 \text{ [C]}$$

$$b = 3 \text{ [m]}$$

$$L = 2 \text{ [m]}$$

Fluid\$ = 'Steam\_IAPWS'

CALL condensation\_VP\_Fluid(Fluid\$,T\_sat, T\_s, b, L: delta\_l, h\_avg, Re\_f, Q, m\_condensed)

Results:

**Local variables in Procedure condensation\_VP\_Fluid (1 call, 0.02 sec)**

b=3 [m]	cp_l = 4205 [J/kg-C]	δ_l = 0.0002002 [m]
Fluid\$='Steam_IAPWS'	g=9.81 [m/s <sup>2</sup> ]	h_avg = 6207 [W/m <sup>2</sup> -C]
h_f = 419169 [J/kg]	h_fg = 2.256E+06 [J/kg]	h_fg' = 2.314E+06 [J/kg]
h_g = 2.676E+06 [J/kg]	k_l = 0.6752 [W/m-C]	L=2 [m]
μ_l = 0.0003144 [kg/m-s]	m_condensed = 0.3219 [kg/s]	v_l = 3.257E-07 [m <sup>2</sup> /s]
Pr_f = 1.958	Q = 744860 [W]	Re = 989.1
Re_f = 1291	ρ_l = 965.3 [kg/m <sup>3</sup> ]	ρ_v = 0.5981 [kg/m <sup>3</sup> ]
T_f = 90 [C]	T_s = 80 [C]	T_sat = 100 [C]

**Thus:**

**h\_avg = 6207 W/m<sup>2</sup>-C....ans.**

**Q = 744860 W...ns.**

**m\_cond = 0.3219 kg/s.....Ans.**

**(b) If the plate is tilted at 30 deg. to vertical, heat tr. coeff. for that case is:**

$h_{inclined} = h_{vert} * (\cos(30))^{(1/4)}$ .

Modify the program above as shown below:

**“Data:”**

T\_sat = 100 [C]

T\_s = 80 [C]

b = 3 [m]

L = 2 [m]

Fluid\$ = 'Steam\_IAPWS'

CALL condensation\_VP\_Fluid(Fluid\$,T\_sat, T\_s, b, L: delta\_l, h\_avg, Re\_f, Q, m\_condensed)

**“For part (b)...plate inclined at 30 deg to vertical:”**

$h_{fg\_prime2} = 2.314E06 [J/kg]$  **“...This is the same as h\_fg\_prime in part (a), copied from there”**

$$\theta = 30 \text{ [deg]}$$

$$h_{\text{inclined}} = h_{\text{avg}} * (\cos(\theta))^{1/4}$$

$$Q_{\text{inclined}} = h_{\text{inclined}} * (L * b) * (T_{\text{sat}} - T_s)$$

$$m_{\text{cond\_inclined}} = Q_{\text{inclined}} / h_{\text{fg\_prime2}}$$

So, we get:

Main condensation_VP_Fluid		
<b>Unit Settings: SI C Pa J mass deg</b>		
b = 3 [m]	$\delta_l = 0.0002002$ [m]	Fluid\$ = 'Steam_IAPWS'
$h_{\text{avg}} = 6207$ [W/m <sup>2</sup> C]	$h_{\text{fg,prime2}} = 2.314E+06$ [J/kg]	$h_{\text{inclined}} = 5988$ [W/m <sup>2</sup> C]
L = 2 [m]	$m_{\text{condensed}} = 0.3219$ [kg/s]	$m_{\text{cond,inclined}} = 0.3105$ [kg/s]
$Q = 744860$ [W]	$Q_{\text{inclined}} = 718551$ [W]	Re <sub>f</sub> = 1291
$\theta = 30$ [deg]	T <sub>s</sub> = 80 [C]	T <sub>sat</sub> = 100 [C]

Main condensation_VP_Fluid		
<b>Local variables in Procedure condensation_VP_Fluid (1 call, 0.02 sec)</b>		
b=3 [m]	cp <sub>l</sub> = 4205 [J/kg-C]	$\delta_l = 0.0002002$ [m]
Fluid\$='Steam_IAPWS'	g=9.81 [m/s <sup>2</sup> ]	$h_{\text{avg}} = 6207$ [W/m <sup>2</sup> C]
$h_f = 419169$ [J/kg]	$h_{\text{fg}} = 2.256E+06$ [J/kg]	$h_{\text{fg}}' = 2.314E+06$ [J/kg]
$h_g = 2.676E+06$ [J/kg]	$k_l = 0.6752$ [W/m-C]	L=2 [m]
$\mu_l = 0.0003144$ [kg/m-s]	$m_{\text{condensed}} = 0.3219$ [kg/s]	$v_l = 3.257E-07$ [m <sup>2</sup> /s]
Pr <sub>f</sub> = 1.958	Q = 744860 [W]	Re = 989.1
Re <sub>f</sub> = 1291	$\rho_l = 965.3$ [kg/m <sup>3</sup> ]	$\rho_v = 0.5981$ [kg/m <sup>3</sup> ]
T <sub>f</sub> = 90 [C]	T <sub>s</sub> = 80 [C]	T <sub>sat</sub> = 100 [C]

So,

**$h_{\text{inclined}} = 5988 \text{ W/m}^2\text{-C} \dots \text{ans.}$**

**$Q_{\text{inclined}} = 718551 \text{ W} \dots \text{ns.}$**

**$m_{\text{cond}} = 0.3105 \text{ kg/s} \dots \text{Ans.}$**

**P lot  $m_{cond}$  vs  $T_s$  for case (a), with  $50 < T_s < 90$  C:**

First, construct the Parametric Table:

1..9	1 $T_s$ [C]	2 $h_{avg}$ [W/m <sup>2</sup> -C]	3 Q [W]	4 $m_{condensed}$ [kg/s]
Run 1	50	4968	1.490E+06	0.6213
Run 2	55	5121	1.383E+06	0.5798
Run 3	60	5287	1.269E+06	0.5353
Run 4	65	5471	1.149E+06	0.4876
Run 5	70	5678	1.022E+06	0.4363
Run 6	75	5918	887635	0.3813
Run 7	80	6207	744860	0.3219
Run 8	85	6579	592094	0.2575
Run 9	90	7109	426522	0.1867

Note that in the same Table, we have obtained the values of  $h_{avg}$  and Q also for various values of  $T_s$ .

As a leading technology company in the field of geophysical science, PGS can offer exciting opportunities in offshore seismic exploration.

We are looking for new BSc, MSc and PhD graduates with Geoscience, engineering and other numerate backgrounds to join us.

Now, plot the results:

=====  
**Prob. 3.2.15.** Refrigerant-12 (R12) condenses on a vertical plate (size: 1 m × 1 m) at 40 C. Plate is held at 20 C. Determine the value of heat transfer coeff and the condensation rate.

**EES Solution:**

Use the EES procedure for vertical plate as in the previous problem.

For Fluid\$ take Fluid\$ = 'R12'

Following is the program:

**“Data:”**

$T_{\text{sat}} = 40$  [C]

$T_s = 20$  [C]

$b = 1$  [m]

$L = 1$  [m]

Fluid\$ = 'R12'

CALL condensation\_VP\_Fluid(Fluid\$, $T_{\text{sat}}$ ,  $T_s$ , b, L: delta\_l, h\_avg, Re\_f, Q, m\_condensed)

Press F2 and we get:

Main   condensation_VP_Fluid		
<b>Unit Settings: SI C Pa J mass deg</b>		
b = 1 [m]	$\delta_l = 0.0001503$ [m]	Fluid\$ = 'R12'
$h_{avg} = 882.4$ [W/m <sup>2</sup> C]	L = 1 [m]	$m_{condensed} = 0.1245$ [kg/s]
$Q = 17648$ [W]	Re <sub>f</sub> = 2205	T <sub>s</sub> = 20 [C]
T <sub>sat</sub> = 40 [C]		

Main   condensation_VP_Fluid		
<b>Local variables in Procedure condensation_VP_Fluid (1 call, 0.05 sec)</b>		
b=1 [m]	cp <sub>l</sub> = 969.4 [J/kg-C]	$\delta_l = 0.0001503$ [m]
Fluid\$='R12'	g=9.81 [m/s <sup>2</sup> ]	$h_{avg} = 882.4$ [W/m <sup>2</sup> C]
$h_f = 74571$ [J/kg]	$h_{fg} = 128625$ [J/kg]	$h_{fg}' = 141809$ [J/kg]
$h_g = 203196$ [J/kg]	$k_l = 0.06732$ [W/m-C]	L=1 [m]
$\mu_l = 0.0002109$ [kg/m-s]	$m_{condensed} = 0.1245$ [kg/s]	$\nu_l = 1.632E-07$ [m <sup>2</sup> /s]
Pr <sub>f</sub> = 3.037	Q = 17648 [W]	Re = 1597
Re <sub>f</sub> = 2205	$\rho_l = 1292$ [kg/m <sup>3</sup> ]	$\rho_v = 55.01$ [kg/m <sup>3</sup> ]
T <sub>f</sub> = 30 [C]	T <sub>s</sub> = 20 [C]	T <sub>sat</sub> = 40 [C]

Thus:

$h_{avg} = 882.4 \text{ W/m}^2\text{-C} \dots \text{Ans.}$

$Q = 17648 \text{ W} \dots \text{Ans.}$

$m_{cond} = 0.1245 \text{ kg/s} \dots \text{Ans.}$

=====  
**Prob. 3.2.16.** Sat. steam at 55 C is to be condensed at a rate of 10 kg/h on the outside of a 3 cm OD vertical tube whose surface is maintained at 45 C. Determine the tube length required.

**EES Solution:**

Use the EES Procedure written above.

We have:

**“Data:”**

T<sub>sat</sub> = 55 [C]

T<sub>s</sub> = 45 [C]

$$D = 0.03 \text{ [m]}$$

Fluid\$ = 'Steam\_IAPWS'

$$\text{mass\_condensed} = 10 * \text{convert}(\text{kg/h}, \text{kg/s})$$

CALL condensation\_VC\_Fluid(Fluid\$,T\_sat, T\_s, D, L: delta\_l, h\_avg, Q, mass\_condensed)

**Note:** In the above CALL to the Procedure, input L is not known; however, output: mass\_condensed is known. It is converted to kg/s from kg/h, since all units are required to be in SI and mass rate is kg/s.

Observe the ease with which EES does these calculations of trial and error.

We get, on clicking F2 to solve:

Main | condensation\_VC\_Fluid

**Unit Settings: SI C Pa J mass deg**

D = 0.03 [m]	$\delta_l = 0.0001637$ [m]	Fluid\$ = 'Steam_IAPWS'
$h_{avg} = 6033$ [W/m <sup>2</sup> C]	<b>L = 1.172</b> [m]	mass_condensed = 0.002778 [kg/s]
<b>Q = 6662</b> [W]	T <sub>s</sub> = 45 [C]	T <sub>sat</sub> = 55 [C]

Main condensation\_VC\_Fluid

**Local variables in Procedure condensation\_VC\_Fluid (5 calls, 0.02 sec)**

$c_{p_l} = 4182$ [J/kg-C]	$D = 0.03$ [m]	$\delta_l = 0.0001637$ [m]
Fluid\$='Steam_IAPWS'	$g = 9.81$ [m/s <sup>2</sup> ]	$h_{avg} = 6033$ [W/m <sup>2</sup> -C]
$h_f = 230259$ [J/kg]	$h_{fg} = 2.370E+06$ [J/kg]	$h'_{fg} = 2.398E+06$ [J/kg]
$h_g = 2.600E+06$ [J/kg]	$k_l = 0.6435$ [W/m-C]	$L = 1.172$ [m]
$mass_{condensed} = 0.002778$ [kg/s]	$\mu_l = 0.0005468$ [kg/m-s]	$\nu_l = 5.535E-07$ [m <sup>2</sup> /s]
$Pr_f = 3.553$	$Q = 6662$ [W]	$Re = 187.3$
$Re_f = 210.3$	$\rho_l = 988$ [kg/m <sup>3</sup> ]	$\rho_v = 0.1046$ [kg/m <sup>3</sup> ]
$T_f = 50$ [C]	$T_s = 45$ [C]	$T_{sat} = 55$ [C]

**Thus: Length of tube required =  $L = 1.172$  m ..... Ans.**

**Note** that  $h$ ,  $Q$ ,  $mass_{cond}$ , and all properties are also immediately available. This becomes very convenient for verification, in case we get any unreasonable results.

**(b) Keeping the tube length as 1.172 m just obtained, plot mass condensed against  $T_s$  for tube diameters of 2 cm, 3 cm and 4 cm:**

Let  $T_s$  vary from 25 C to 50 C:

We modify the program as follows:

**“Data:”**

```
T_sat = 55 [C]
{T_s = 45 [C]}
D = 0.03 [m]
L = 1.172[m]
```

```
{mass_condensed = 10 * convert(kg/h, kg/s)}
```

```
Fluid$ = 'Steam_IAPWS'
```

```
CALL condensation_VC_Fluid(Fluid$,T_sat, T_s, D, L: delta_l, h_avg, Q, mass_condensed)
```

Note that in the above program,  $T_s$  is 'commented out' since it is the variable in the Parametric Table.

L is entered as 1.21 m. Then, we call the Procedure to get mass\_condensed.

Following are the 3 parametric Tables for D = 2, 3 and 4 cm:

**D = 2cm:**

	1	2
	$T_s$ [C]	mass <sub>condensed</sub> [kg/s]
Run 1	25	0.004162
Run 2	30	0.003674
Run 3	35	0.003132
Run 4	40	0.00253
Run 5	45	0.001852
Run 6	50	0.001071

**D = 3cm:**

	1	2
	$T_s$ [C]	mass <sub>condensed</sub> [kg/s]
Run 1	25	0.006243
Run 2	30	0.00551
Run 3	35	0.004698
Run 4	40	0.003794
Run 5	45	0.002779
Run 6	50	0.001606

D = 4 cm:

	1	2
	T <sub>s</sub> [C]	mass <sub>condensed</sub> [kg/s]
Run 1	25	0.008325
Run 2	30	0.007347
Run 3	35	0.006264
Run 4	40	0.005059
Run 5	45	0.003705
Run 6	50	0.002141

## Technical training on *WHAT* you need, *WHEN* you need it

At IDC Technologies we can tailor our technical and engineering training workshops to suit your needs. We have extensive experience in training technical and engineering staff and have trained people in organisations such as General Motors, Shell, Siemens, BHP and Honeywell to name a few.

Our onsite training is cost effective, convenient and completely customisable to the technical and engineering areas you want covered. Our workshops are all comprehensive hands-on learning experiences with ample time given to practical sessions and demonstrations. We communicate well to ensure that workshop content and timing match the knowledge, skills, and abilities of the participants.

We run onsite training all year round and hold the workshops on your premises or a venue of your choice for your convenience.

For a no obligation proposal, contact us today at [training@idc-online.com](mailto:training@idc-online.com) or visit our website for more information: [www.idc-online.com/onsite/](http://www.idc-online.com/onsite/)

Now, plot them on the same plot:

=====  
**Prob.3.2.17.** A horizontal tube, 1 m long has its surface temp maintained at 70 C. Sat. steam at 1 atm pressure condenses over it. (a) What is the diameter required to achieve a condensation rate of 125 kg/h? (b) Plot the condensation rate as a function of surface temp for  $T_s$  between 70 and 90 C and for diameters of 125, 150 and 175 mm. (Ref. 3)

**EES Solution:**

**This is the same as Prob. 3.2.8, which was solved with Mathcad.**

Now, we shall solve it with EES, using the Procedure for a horizontal cylinder written above.

Following is the EES program with a call to the Procedure:

**“Data:”**

$T_{sat} = 100$  [C]

$T_s = 70$  [C]

$L = 1$  [m]

Fluid\$ = 'Steam\_IAPWS'

mass\_condensed = 125 \* convert(kg/h, kg/s)

CALL condensation\_HC\_Fluid(Fluid\$,T\_sat, T\_s, D, L: h\_avg, Q, mass\_condensed)

Note that, in the above program, one of the inputs, viz. D is not known; however, one of the outputs i.e. mass\_condensed is given. It is converted here from kg/h to kg/s since SI units are to be used throughout.

*It is interesting to see the ease with which this is solved with EES:*

Click F2 to solve:

We get:

The screenshot shows the EES software interface with the following input variables defined:

- D = 0.1441 [m]
- L = 1 [m]
- T<sub>s</sub> = 70 [C]
- Fluid\$ = 'Steam\_IAPWS'
- mass\_condensed = 0.03472 [kg/s]
- T<sub>sat</sub> = 100 [C]
- h<sub>avg</sub> = 5988 [W/m<sup>2</sup>C]
- Q = 81324 [W]

The screenshot shows the local variables for the procedure call 'condensation\_HC\_Fluid' (12 calls, 0.03 sec):

cp <sub>l</sub> = 4201 [J/kg-C]	D = 0.1441 [m]	Fluid\$ = 'Steam_IAPWS'
g = 9.81 [m/s <sup>2</sup> ]	h <sub>avg</sub> = 5988 [W/m <sup>2</sup> C]	h <sub>f</sub> = 419169 [J/kg]
h <sub>fg</sub> = 2.256E+06 [J/kg]	h <sub>fg</sub> ' = 2.342E+06 [J/kg]	h <sub>g</sub> = 2.676E+06 [J/kg]
k <sub>l</sub> = 0.6728 [W/m-C]	L = 1 [m]	mass_condensed = 0.03472 [kg/s]
μ <sub>l</sub> = 0.0003333 [kg/m-s]	v <sub>l</sub> = 3.441E-07 [m <sup>2</sup> /s]	Pr <sub>f</sub> = 2.081
Q = 81324 [W]	ρ <sub>l</sub> = 968.6 [kg/m <sup>3</sup> ]	ρ <sub>v</sub> = 0.5981 [kg/m <sup>3</sup> ]
T <sub>f</sub> = 85 [C]	T <sub>s</sub> = 70 [C]	T <sub>sat</sub> = 100

**Thus:**

**Dia of tube to get a condensation rate of 125 kg/h (i.e. 0.03472 kg/s) is = D = 0.1441 m ...Ans.**

**Note: This matches with the result we got with Mathcad earlier.**

**To plot mass\_cond vs Ts for = 125, 150 and 175 mm:**

Compute the Parametric Tables for these three diameters:

Modify the earlier program as follows:

**“Data:”**

T\_sat = 100 [C]

{T\_s = 70 [C]}

L = 1[m]

D = 0.125 [m]

Fluid\$ = 'Steam\_IAPWS'

CALL condensation\_HC\_Fluid(Fluid\$,T\_sat, T\_s, D, L: h\_avg, Q, mass\_condensed)

In the above, D is entered as 0.125 m. Ts is 'commented out' since it is now the variable for the Parametric Table.

We have 3 Parametric Tables for three values of Diameters:

**D = 125 mm:**

Run	T <sub>s</sub> [C]	mass <sub>condensed</sub> [kg/s]
Run 1	70	0.03121
Run 2	72	0.02979
Run 3	74	0.02832
Run 4	76	0.0268
Run 5	78	0.02523
Run 6	80	0.02361
Run 7	82	0.02192
Run 8	84	0.02016
Run 9	86	0.01833
Run 10	88	0.0164
Run 11	90	0.01438

D = 150 mm:

1..11	1 $T_s$ [C]	2 mass <sub>condensed</sub> [kg/s]
Run 1	70	0.03578
Run 2	72	0.03415
Run 3	74	0.03247
Run 4	76	0.03073
Run 5	78	0.02893
Run 6	80	0.02706
Run 7	82	0.02513
Run 8	84	0.02312
Run 9	86	0.02101
Run 10	88	0.01881
Run 11	90	0.01648

Run 10	88		0.02111
Run 11	90		0.0185

Now, plot the results:

Note: These results match with those obtained with Mathcad in Prob. 3.2.8.

**Prob. 3.2.18.** Sat. NH<sub>3</sub> vapour at 10 C condenses on the outside of a 2 cm dia, 5 m long horizontal tube whose surface is maintained at -10 C. Determine: (a) rate of heat transfer (b) rate of condensation. (Ref. 2)

**EES Solution:**

Use the EES procedure written for condensation of a Fluid on the outside of a horizl cylinder:

“Data:”

$$T_{\text{sat}} = 10 \text{ [C]}$$

$$T_s = -10 \text{ [C]}$$

$$L = 5 \text{ [m]}$$

$$D = 0.02 \text{ [m]}$$

$$\text{Fluid\$} = \text{'Ammonia'}$$

$$\text{CALL condensation\_HC\_Fluid}(\text{Fluid\$}, T_{\text{sat}}, T_s, D, L: h_{\text{avg}}, Q, \text{mass\_condensed})$$

Press F2 to solve, and we get:

Main   condensation_HC_Fluid		
<b>Unit Settings: SI C Pa J mass deg</b>		
D = 0.02 [m]	Fluid\$ = 'Ammonia'	$h_{\text{avg}} = 7807 \text{ [W/m}^2\text{-C]}$
L = 5 [m]	mass_condensed = 0.03808 [kg/s]	$Q = 49050 \text{ [W]}$
T <sub>s</sub> = -10 [C]	T <sub>sat</sub> = 10 [C]	

Main   condensation_HC_Fluid		
<b>Local variables in Procedure condensation_HC_Fluid (1 call, 0.03 sec)</b>

μ <sub>l</sub> = 0.0001702 [kg/m-s]	v <sub>l</sub> = 2.666E-07 [m <sup>2</sup> /s]	Pr <sub>f</sub> = 1.405
Q = 49050 [W]	ρ <sub>l</sub> = 638.7 [kg/m <sup>3</sup> ]	ρ <sub>v</sub> = 4.885 [kg/m <sup>3</sup> ]
T <sub>f</sub> = 0 [C]	T <sub>s</sub> = -10 [C]	T <sub>sat</sub> = 10

**Thus:**

$$h_{avg} = 7807 \text{ W/m}^2\text{-C....Ans.}$$

$$Q = 49050 \text{ W...Ans.}$$

$$m_{cond} = 0.03808 \text{ kg/s}$$

=====

**Prob. 3.2.19.** A steam condenser consists of a square array of 400 horizontal tubes, each 6 mm in diameter. The tubes are exposed to exhaust steam arriving from the turbine at a pressure of 0.1 bar. If the tube surface temperature is maintained at a temperature of 25 C by circulating cold water through the tubes, determine the heat transfer coefficient and the rate at which the steam is condensed per unit length of tubes for the entire array. Assume laminar film condensation and that there are no condensable gases mixed with steam. (Ref. 1)

**EES Solution:**

Now, we shall solve this problem using the Procedure for an array of horizontal cylinders in a vertical tier, written above.

Following is the EES program with a call to the Procedure:

**“Data:”**

$$T_{sat} = 45.8 \text{ [C]} \text{..Tsaf for Water at a pressure of 0.1 bar”}$$

$$T_s = 25 \text{ [C]}$$

$$L = 1 \text{ [m]}$$

$$D = 0.006 \text{ [m]}$$

$$N_{total} = 400$$

$$N = 20 \text{ “ i.e. } N = 400^{0.5}, \text{ since there are 400 tubes in a square array.”}$$

$$\text{Fluid\$} = \text{'Steam\_IAPWS'}$$

$$\text{CALL condensation\_HTBank\_Fluid}(\text{Fluid\$}, T_{sat}, T_s, D, L, N, N_{total}: h_{avg}, Q, \text{mass\_condensed})$$

Click F2 to solve, and we get:

Main condensation\_HTBank\_Fluid

**Unit Settings: SI C Pa J mass deg**

D = 0.006 [m]	Fluid\$ = 'Steam_IAPWS'	$h_{avg} = 5499$ [W/m <sup>2</sup> C]
L = 1 [m]	mass <sub>condensed</sub> = 0.3518 [kg/s]	N = 20
N <sub>total</sub> = 400	Q = 862415 [W]	T <sub>s</sub> = 25 [C]
T <sub>sat</sub> = 45.8 [C]		

Main condensation\_HTBank\_Fluid

**Local variables in Procedure condensation\_HTBank\_Fluid (1 call, 0.02 sec)**

cp <sub>l</sub> = 4180 [J/kg-C]	D = 0.006 [m]	Fluid\$ = 'Steam_IAPWS'
g = 9.81 [m/s <sup>2</sup> ]	h <sub>avg</sub> = 5499 [W/m <sup>2</sup> C]	h <sub>f</sub> = 191782 [J/kg]
h <sub>fg</sub> = 2.392E+06 [J/kg]	h <sub>fg</sub> ' = 2.451E+06 [J/kg]	h <sub>g</sub> = 2.584E+06 [J/kg]
k <sub>l</sub> = 0.6239 [W/m-C]	L = 1 [m]	mass <sub>condensed</sub> = 0.3518 [kg/s]
μ <sub>l</sub> = 0.0007136 [kg/m-s]	N = 20	ν <sub>l</sub> = 7.180E-07 [m <sup>2</sup> /s]
N <sub>total</sub> = 400	Pr <sub>f</sub> = 4.781	Q = 862415 [W]
ρ <sub>l</sub> = 993.8 [kg/m <sup>3</sup> ]	ρ <sub>v</sub> = 0.06815 [kg/m <sup>3</sup> ]	T <sub>f</sub> = 35.4 [C]
T <sub>s</sub> = 25 [C]	T <sub>sat</sub> = 45.8 [C]	

“I studied English for 16 years but...  
...I finally learned to speak it in just six lessons”

ENGLISH OUT THERE

Click to hear me talking before and after my unique course download

Thus:

Heat transfer coeff.,  $h_{avg} = 5499 \text{ W/m}^2\text{-C} \dots \text{Ans.}$

Total heat transfer for the array,  $Q = 862415 \text{ W} \dots \text{Ans.}$

Mass condensed for the entire array =  $0.3518 \text{ kg/s} = 1266 \text{ kg/h} \dots \text{Ans.}$

Now, if  $T_{sat}$  varies from 30 C to 54 C (corresponding to sat. pressure of 4.246 kPa to 15.02 kPa respectively), plot Q and  $m_{cond}$  against  $T_{sat}$ :

First, compute the Parametric Table:

Table 1			
1..13	1 $T_{sat}$ [C]	2 Q [W]	3 $m_{condensed}$ [kg/s]
Run 1	30	279962	0.1145
Run 2	32	363016	0.1485
Run 3	34	441539	0.1805
Run 4	36	516976	0.2113
Run 5	38	590170	0.2411
Run 6	40	661665	0.2702
Run 7	42	731833	0.2988
Run 8	44	800946	0.3269
Run 9	46	869207	0.3546
Run 10	48	936771	0.382
Run 11	50	1.004E+06	0.4092
Run 12	52	1.070E+06	0.4362
Run 13	54	1.136E+06	0.4629

Now, plot the results:

=====

**Prob. 3.2.20.** Refrigerant 12 (R12) at 35 C is to be condensed at the rate of 10000 kg/h on a square array of 25 × 25 tubes, each tube of 12 mm OD, maintained at 25 C. Calculate the length of each tube required.

**EES Solution:**

Use the EES procedure for a Tube bank:

**“Data:”**

$$T_{\text{sat}} = 35 \text{ [C]}$$

$$T_s = 25 \text{ [C]}$$

$$D = 0.012 \text{ [m]}$$

$$N_{\text{total}} = 625$$

$$N = 25 \text{ “i.e. } N = 400^{0.5}, \text{ since there are 400 tubes in a square array.”}$$

$$\text{mass\_condensed} = 10000 * \text{convert}(\text{kg/h, kg/s})$$

$$\text{Fluid\$} = \text{'R12'}$$

$$\text{CALL condensation\_HTBank\_Fluid}(\text{Fluid\$}, T_{\text{sat}}, T_s, D, L, N, N_{\text{total}}: h_{\text{avg}}, Q, \text{mass\_condensed})$$

=====  
**Prob. 3.2.21.** Ammonia at 40 C is condensing inside a horizontal tube of 16 mm ID. Mass velocity of ammonia vapour at inlet is 20 kg/(m<sup>2</sup>.s). Surface of the tube is maintained at a constant temperature of 20 C by circulating cold water. Calculate the fraction of vapour that will condense if the tube is 0.5 m long.(Ref.1)

**EES Solution:**

This is the case of condensation inside a horizontal tube.

Chato's relation is valid for Re<sub>vap</sub> < 35000. See the formulas at the beginning of the Chapter.

See the EES Procedure for condensation inside a horizontal tube for any Fluid, written earlier:

Following is the worksheet:

**“Data:”**

- T<sub>sat</sub> = 40 [C]
- T<sub>s</sub> = 20 [C]
- L = 0.5 [m]
- D = 0.016 [m]

Fluid\$ = 'Ammonia'

G = 20 [kg/m<sup>2</sup>-s] "...mass velocity of NH3"

A\_c = pi \* d<sup>2</sup> / 4 "[m<sup>2</sup>].....area of cross-section of tube"

rho\_v = Density(Fluid\$,T=T\_sat, x=1) "[kg/m<sup>3</sup>]"

mu\_v = Viscosity(Fluid\$,T=T\_sat,x=1) "[kg/m-s]"

U\_v = G / rho\_v "[m/s]...velocity of NH3 vap"

{Re\_v = G D / mu\_v}

CALL condensation\_InsideHCyl(Fluid\$,T\_sat, T\_s, D, L, U\_v: h\_avg, Q, mass\_condensed)

mass\_in = G \* A\_c "[kg/s] ... mass flow rate of vap at inlet"

Fraction = mass\_condensed / mass\_in "...Fraction of vapour condensed"

Click F2 to solve, and we get:

Main   condensation_InsideHCyl		
<b>Unit Settings: SI C Pa J mass deg</b>		
A <sub>c</sub> = 0.0002011 [m <sup>2</sup> ]	D = 0.016 [m]	Fluid\$ = 'Ammonia'
<b>Fraction = 0.6122</b>	G = 20 [kg/m <sup>2</sup> -s]	<b>h<sub>avg</sub> = 5562 [W/m<sup>2</sup>-C]</b>
L = 0.5 [m]	<b>mass<sub>condensed</sub> = 0.002462 [kg/s]</b>	mass <sub>in</sub> = 0.004021 [kg/s]
μ <sub>v</sub> = 0.00001033 [kg/m-s]	<b>Q = 2796 [W]</b>	ρ <sub>v</sub> = 12.02 [kg/m <sup>3</sup> ]
T <sub>s</sub> = 20 [C]	T <sub>sat</sub> = 40 [C]	U <sub>v</sub> = 1.663 [m/s]

Main   condensation_InsideHCyl		
<b>Local variables in Procedure condensation_InsideHCyl (1 call, 0.02 sec)</b>		
cp <sub>l</sub> = 4827 [J/kg-C]	D = 0.016 [m]	Fluid\$ = 'Ammonia'
g = 9.81 [m/s <sup>2</sup> ]	h <sub>avg</sub> = 5562 [W/m <sup>2</sup> -C]	h <sub>f</sub> = 390639 [J/kg]
h <sub>fg</sub> = 1.099E+06 [J/kg]	h <sub>fg'</sub> = 1.136E+06 [J/kg]	h <sub>g</sub> = 1.490E+06 [J/kg]
k <sub>l</sub> = 0.4714 [W/m-C]	L = 0.5 [m]	mass <sub>condensed</sub> = 0.002462 [kg/s]
μ <sub>l</sub> = 0.0001255 [kg/m-s]	μ <sub>v</sub> = 0.00001033 [kg/m-s]	ν <sub>l</sub> = 2.109E-07 [m <sup>2</sup> /s]
Pr <sub>f</sub> = 1.285	Q = 2796 [W]	Re <sub>vap</sub> = 30991
ρ <sub>l</sub> = 595.3 [kg/m <sup>3</sup> ]	ρ <sub>v</sub> = 12.02 [kg/m <sup>3</sup> ]	T <sub>f</sub> = 30 [C]
T <sub>s</sub> = 20 [C]	T <sub>sat</sub> = 40 [C]	U <sub>v</sub> = 1.663 [m/s]

Thus:

$$h_{avg} = 5562 \text{ W/m}^2\cdot\text{C} \dots\text{Ans.}$$

$$Q = 2796 \text{ W} \dots \text{Ans.}$$

$$\text{Mass}_{cond} = 0.002462 \text{ kg/s} \dots \text{Ans.}$$

$$\text{Mass}_{in} = 0.004021 \text{ kg/s}$$

Therefore, fraction of Mass condensed:

$$\text{Fraction} = 0.6122 = 61.22 \% \dots \text{Ans.}$$

=====

**Prob. 3.2.22.** Sat.steam at 1 atm condenses on a 0.5 m high, 0.2 m wide vertical plate maintained at 90 C. Determine: (a) the thickness of film at the bottom of the plate,  $\delta_L$ , (b) film Reynolds No.  $Re_f$ , (c) heat transfer coeff.  $h_{avg}$ , (d) total heat transfer, Q, and (e) the condensation rate.

**EXCEL Solution:**

Let us solve this problem in EXCEL.

We have already written VBA Functions for the properties of sat. water, air etc. and we shall use the same worksheet.

Following are the steps:

1. Set up the EXCEL worksheet, enter data and name the cells:

T\_f      f\_x      =(T\_s+T\_sat)/2

	A	B	C	D	E	F
209						
210		<b>Data:</b>	Fluid =	Water		
211		Surface temp	T_s	90	C	
212		Sat. temp.	T_sat	100.0	C	
213		Avg. temp	T_f	95.0	C	$T_f = (T_s + T_{sat}) / 2$
214		Height of plate	L	0.5	m	
215		Width of plate	B	0.2	m	
216		Inclination to vertical	theta	0.0	deg.	
217		Accn. due to gravity	g	9.810	m/s^2	

- Calculate the properties of water, using the VBA Functions already write. Note that liquid properties are determined at the mean temp,  $T_f$  and heat of vapourization  $h_{fg}$  and properties of vapour are determined at the sat. temp  $T_{sat}$ :

h\_fg      fx      =SatH2O\_hfg\_T((T\_sat+273.15))

	A	B	C	D	E	F	G
221		Calculations:					
222		Props. of liquid.. at Tf:					
223		density_liq	rho_L	961.6401735	kg/m^3		
224		dyn. Visc_liq	mu_L	0.000295	N.s/m^2		
225		kinem. Visc. of liq	nu_L	3.07069E-07	m^2/s		
226		th. conductivity_liq	k_L	0.67826	W/m.C		
227		sp.heat_liq	cp_L	4212.15	J/kg.K		
228		Prandtl No._liq	Pr_L	1.8407			
229							
230							
231		Props of vapour: at Tsat:					
232		density_vap	rho_V	0.5956	kg/m^3		
233		sp.heat_vap	cp_V	2029	J/kg.K		
234		th. conductivity_vap	k_V	0.0248	W/m.C		
235		Heat of vaporization	h_fg	2257000	J/kg		
236		Modified h_fg	h_fg_prime	2285642.62	J/kg		
237							

Using VBA Functions for Props. of Sat. water

$h_{fg\_prime} = h_{fg} + 0.68 * cp\_L * (T_{sat} - T_s)$

**MSM**

3. Now, continue the calculations to find thickness of condensate film at the lower end of plate, i.e. at  $x = L$ , ( $\delta_L$ ), local heat transfer coeff.  $h_L$  at  $x = L$ , and the film Reynolds No. ( $Re$ ), as shown below. Equations used are also shown in the worksheet, for clarity:

delta_L		fx = (4*mu_L*k_L*(T_sat-T_s)*L/(g*rho_L*(rho_L-rho_V)*h_fg_prime))^(1/4)				
B	C	D	E	F	G	
236	Modified h_fg	h_fg_prime	2285642.62	J/kg		
237				$h_{fg\_prime} = h_{fg} + 0.68 * c_{p\_L} * (T_{sat} - T_s)$		
	thickness of film at dist. L from top of plate	delta_L	0.000117913	m	$\delta_L = \left[ \frac{4 \cdot \mu_L \cdot k_L \cdot (T_{sat} - T_s) \cdot L}{g \cdot \rho_L \cdot (\rho_L - \rho_V) \cdot h_{fg\_prime}} \right]^{\frac{1}{4}}$	
239	local heat tr coeff	h_L	5752.225	W/m^2.C	$h_L = \frac{k_L}{\delta_L}$	
241	Reynolds No.	Re	227.273		$Re = \frac{4 \cdot g \cdot \rho_L \cdot (\rho_L - \rho_V) \cdot \delta_L^3}{3 \cdot \mu_L^2}$	
242						
243						

4.  $Re$  calculated above indicates the if the film is laminar, laminar-wavy, or turbulent. Equations for the average heat transfer coeff,  $h_{vert}$ , in three types of flow are given at the beginning of the Chapter and are reproduced below. These values are calculated separately and kept ready, and the appropriate value is chosen depending on value of  $Re$ , using an IF Function in EXCEL:

**For Laminar film: (i.e.  $0 < Re \leq 30$ ):**

$$h_{vert} = 1.47 \cdot Re^{\frac{-1}{3}} \cdot k_L \cdot \left( \frac{g}{\nu_L^2} \right)^{\frac{1}{3}} \quad \text{if } 0 < Re \leq 30$$

**For Laminar-wavy film: (i.e.  $30 < Re \leq 1800$ ):**

$$h_{vert} = \frac{Re \cdot k_L}{1.08 \cdot Re^{1.22} - 5.2} \cdot \left( \frac{g}{\nu_L^2} \right)^{\frac{1}{3}}$$

$$Re_f = \left[ 4.81 + \frac{3.7 \cdot L \cdot k_L \cdot (T_{sat} - T_s)}{\mu_L \cdot h_{fg\_prime}} \cdot \left( \frac{g}{\nu_L^2} \right)^{\frac{1}{3}} \right]^{0.82}$$

For turbulent film: (i.e.  $Re > 1800$ ):

$$h_{\text{vert}} = \frac{Re \cdot k_L}{8750 + 58 \cdot Pr_L^{-0.5} \cdot (Re^{0.75} - 253)} \cdot \left( \frac{g}{\nu_L^2} \right)^{\frac{1}{3}}$$

$$Re_f = \left[ \frac{0.069 L \cdot k_L \cdot Pr_L^{0.5} \cdot (T_{\text{sat}} - T_s)}{\mu_L \cdot h_{fg\_prime}} \cdot \left( \frac{g}{\nu_L^2} \right)^{\frac{1}{3}} - 151 \cdot Pr_L^{0.5} + 253 \right]^{\frac{4}{3}}$$

	B	C	D	E	F	G	
244	Now, depending upon above value of Re, get h_vert and Re_vert:(Ref: Cengel)					h_vert_lam	7684.163798
245					h_vert_wavy	9010.075542	
246	Avg. heat tr. coeff.	h_vert	9010.076	W/m^2.C	Re_vert_wavy	259.5109239	
247	Reynolds No.	Re_vert	259.511		h_vert_turb	16606.31957	
248	Film flow range:	Film flow is:	Laminar_wavy		Re_vert_turb	289.9080821	
249	Heat transfer:	Q	9010.076	W	Q = h_vert · (L · B) · (T_sat - T_s)		
250	Condensation rate:	m_cond	0.003942032	kg/s	m_cond = $\frac{Q}{h_{fg\_prime}}$		
251	Condens. rate per hour:	m_cond_per_hour	14.191	kg/h			
252							

In the above, yellow-filled box at the right corner calculates the values of h\_vert separately and the cells are 'named'. Then, actual values of h\_vert and Re\_vert are transferred to cells D246 and D247 using the IF Function. Formula of IF Function entered in cell D246 can be seen in the Formula bar.

5. Thus, the results are:

$\Delta L = 0.000117913 \text{ m} \dots$  thickness of condensate film at the bottom of plate (i.e. at  $x = 0.5 \text{ m}$ )

$Re_f = 259.511 =$  Reynolds No. ...Laminar wavy region

$h_{\text{avg}} = h_{\text{vert}} = 9010.1 \text{ W/m}^2\text{.C} =$  avg heat transfer coeff

$Q = 9010.71 \text{ W} =$  heat tr to plate

$m_{\text{cond}} = 0.003942 \text{ kg/s} = 14.191 \text{ kg/h} \dots$ Ans.

6. If the plate is inclined to vertical at 30 deg. what are the changes in results?

For an inclined plate, inclined at an angle of  $\theta$  deg. to vertical, we have:

$$h_{\text{inclined}} = h_{\text{vert}} \times (\cos(\theta))^{1/4}$$

Following worksheet shows these calculations:

D256		fx =h_vert*(COS(D255))^(1/4)		
	B	C	D	E
250	Condensation rate:	m_cond	0.003942032	kg/s
251	Condens. rate per hour:	m_cond_per_hour	14.191	kg/h
252				
253	If the plate is inclined at 'theta' deg. to vertical:			
254	Angle of incln. to vert.	theta	30	deg.
255	theta in radians	theta_rad	0.523598776	radians
256	heat tr coeff.	h_inclined	8691.827	W/m^2.C
257	Heat transfer:	Q_inclined	8691.827	W
258	Condensation rate:	m_cond_incl	0.003803	kg/s
259	Condens. rate per hour:	m_cond_incl_per_hour	13.690	kg/h

READ MORE & PRE-ORDER TODAY  
[WWW.GAITEYE.COM](http://WWW.GAITEYE.COM)

In the above worksheet, note that theta was converted from degrees to radians, since EXCEL requires that arguments to Trigonometric Functions such as Sin, Cos etc. should be in radians.

Thus, we get, for the plate inclined at 30 deg to vertical:

$$h_{avg} = h_{inclined} = 8691.83 \text{ W/m}^2\cdot\text{C} = \text{avg heat transfer coeff}$$

$$Q_{inclined} = 8691.83 \text{ W} = \text{heat tr to inclined plate}$$

$$m_{cond\_incl} = 0.003803 \text{ kg/s} = 13.69 \text{ kg/h} \dots\text{Ans.}$$

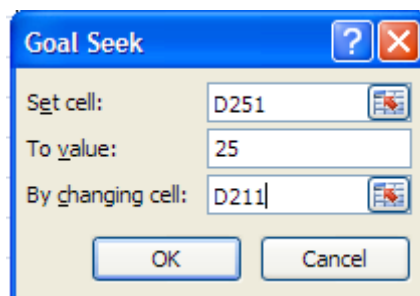

**7. For the vertical plate, what should be the surface temp to achieve a condensation rate of 25 kg/h?**

This is calculated very easily using the Goal Seek in EXCEL. We will apply Goal Seek, to make cell D251 zero, by changing cell D211 (i.e. value of T<sub>s</sub>): Following is the procedure:

Select cell D251, and go to Data – WhatIf Analysis – Goal Seek:

Click on Goal Seek. We get the following screen. Fill it up as explained above:

Press OK. We get:

i.e. Goal Seek has found a solution. Again click OK and see the value of T<sub>s</sub> in cell D211:

210	Data:	Fluid =	Water	
211	Surface temp	T <sub>s</sub>	79.3601	C
212	Sat. temp.	T <sub>sat</sub>	100.0	C
213	Avg. temp	T <sub>f</sub>	89.7	C
214	Height of plate	L	0.5	m
215	Width of plate	B	0.2	m
216	Inclination to vertical	theta	0.0	deg.
217	Accn. due to gravity	g	9.810	m/s <sup>2</sup>

$$T_f = (T_s + T_{sat}) / 2$$

Thus:

Surface temp required to get a cond. rate of 25 kg/h is: T<sub>s</sub> = 79.3601 deg. C....Ans.

8. Now, plot the surface temps for different condensation rates (from 15 to 50 kg/h):

Here, we have to apply Goal Seek to each value of m<sub>cond</sub>. So, it is convenient to write a small VBA program:

First, set up a Table as shown below:

	A	B	C	D	E
262		<b>Plot T<sub>s</sub> for m<sub>cond</sub> values ranging from 10 kg/h to 50 kg/h:</b>			
263			m <sub>cond</sub> -starting value = m <sub>initial</sub>	10	kg/h
264			m <sub>cond</sub> _final value = m <sub>final</sub>	50	...upper limit is 65 kg/h
265		Change these two values between 0 and 65 and click CommandButton1			
266					
267		<b>m<sub>cond</sub> (kg/h)</b>	<b>h<sub>vert</sub> (W/m<sup>2</sup>.C)</b>	<b>Q (W)</b>	<b>T<sub>s</sub> (deg.C)</b>
268					
269					
270					
271					
272					
273					
274					
275					
276					

Here, we enter the range of  $m_{cond}$  desired in cells D263 and D264 as shown.

Table has 9 rows; so increment will be:  $Inc = (final\ value - initial\ value) / 8 = 5$

Now, we will have a control button to operate our VBA program.

So, go to: Developer – Insert – ActiveX controls:

**OLIVER WYMAN**

Oliver Wyman is a leading global management consulting firm that combines deep industry knowledge with specialized expertise in strategy, operations, risk management, organizational transformation, and leadership development. With offices in 50+ cities across 25 countries, Oliver Wyman works with the CEOs and executive teams of Global 1000 companies.  
An equal opportunity employer.

**GET THERE FASTER**

Some people know precisely where they want to go. Others seek the adventure of discovering uncharted territory. Whatever you want your professional journey to be, you'll find what you're looking for at Oliver Wyman.

Discover the world of Oliver Wyman at [oliverwyman.com/careers](http://oliverwyman.com/careers)

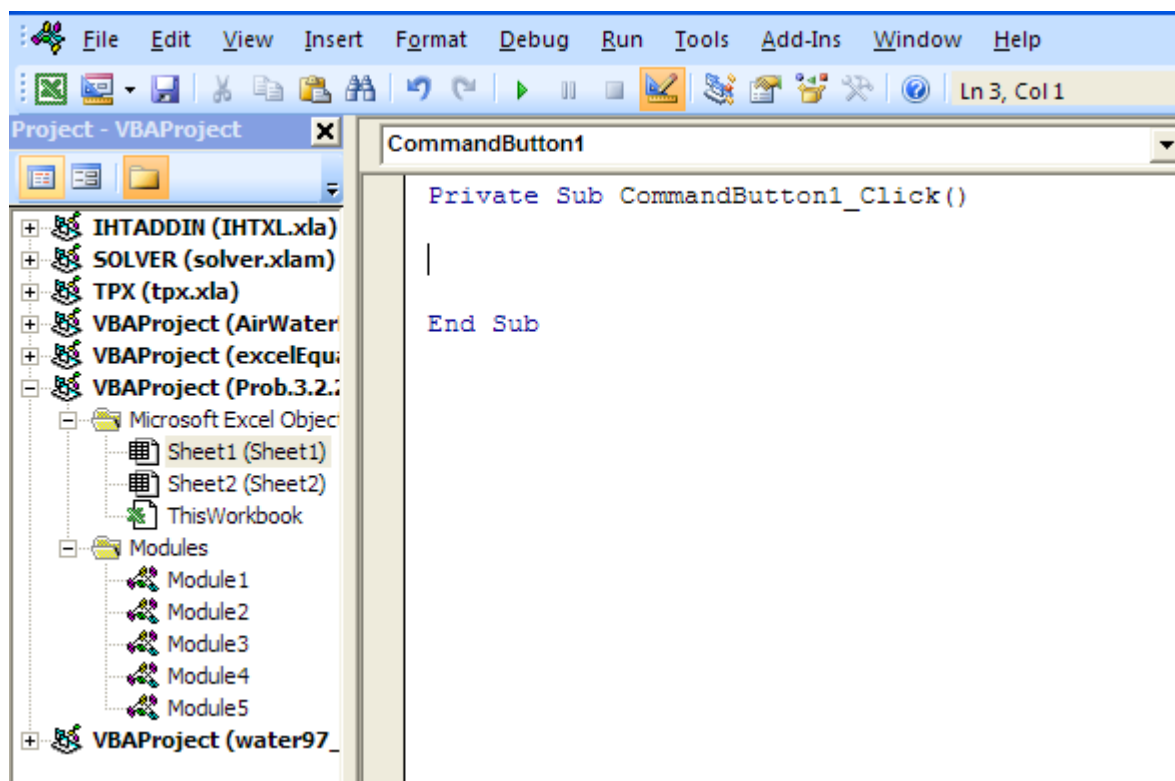

Click on first, left button under ActiveX Controls, and locate the button at the required place in the worksheet and adjust its size:

262	Plot T <sub>s</sub> for m <sub>cond</sub> values ranging from 10 kg/h to 50 kg/h:				CommandButton1
263		m <sub>cond</sub> -starting value = m <sub>initial</sub>	10	kg/h	
264		m <sub>cond</sub> -final value = m <sub>final</sub>	50	...upper limit is 65 kg/h	
265	Change these two values between 0 and 65 and click CommandButton1				
266					
267	m <sub>cond</sub> (kg/h)	h <sub>vert</sub> (W/m <sup>2</sup> .C)	Q (W)	T <sub>s</sub> (deg.C)	
268					
269					
270					
271					
272					
273					
274					
275					
276					

Now, in Developer tab, click VisualBasic (extreme left) and we see under Sheet 1, the VBA program for this control button:

Now, modify this program to:

generate the value of  $m_{cond}$  within the desired range and apply Goal Seek, get the values of  $h$ ,  $Q$  and  $T_s$  for each case, and write them all at appropriate places in the Table.

Following is the program:

```

CommandButton1 Click
Private Sub CommandButton1_Click()
Dim i As Integer
Dim m_initial As Double, m_final As Double, Inc As Double

m_initial = Range("D263") 'starting value for m_cond
m_final = Range("D264") 'starting value for m_cond

Inc = (m_final - m_initial) / 8

For i = 0 To 8
Range("D251").GoalSeek Goal:=m_initial + i * Inc, ChangingCell:=Range("D211") 'This line performs Goal Seek
Cells(268 + i, 2) = m_initial + i * Inc 'Fills the first column of Table, i.e. m_cond values
Cells(268 + i, 3) = Range("D246") 'Fills the second column of Table, i.e. h_vert values
Cells(268 + i, 4) = Range("D249") 'Fills the third column of Table, i.e. Q values
Cells(268 + i, 5) = Range("D211") 'Fills the fourth column of Table, i.e. T_s values

Next i
End Sub
    
```

In the above program, read the comments given to see what each line does.

Now, click on the CommandButton1 and we get:

	A	B	C	D	E	F
262		Plot $T_s$ for $m_{cond}$ values ranging from 10 kg/h to 50 kg/h:				CommandButton1
263			$m_{cond}$ -starting value = $m_{initial}$	10	kg/h	
264			$m_{cond}$ _final value = $m_{final}$	50	...upper limit is 65 kg/h	
265		Change these two values between 0 and 65 and click CommandButton1				
266						
267		$m_{cond}$ (kg/h)	$h_{vert}$ (W/m <sup>2</sup> .C)	Q (W)	$T_s$ (deg.C)	
268		10	9785.894	6320.857	93.541	
269		15	8890.174	9532.118	89.278	
270		20	8275.042	12784.572	84.550	
271		25	7792.478	16083.592	79.360	
272		30	7392.308	19434.487	73.710	
273		35	7040.901	22844.055	67.555	
274		40	6718.590	26320.306	60.825	
275		45	6411.791	29873.807	53.408	
276		50	6139.606	33507.805	45.424	

Now, plot the graph:

9. Now, if we need the  $T_s$  values for another range of mass\_condensed, we have to just enter the desired values in cells D263 and D264 and click the CommandButton1. **But, take care to see that upper limit for mass condensed should not go beyond 65 kg/h, since otherwise,  $T_s$  value will go below zero and the program will stop.**

For ex: let us have  $m_{cond}$  between 0 and 65 kg/h:

Then, enter the values in D263 and D264 as shown and click CommandButton1. We get:

Plot $T_s$ for $m_{cond}$ values ranging from 10 kg/h to 50 kg/h:				CommandButton1
m_cond-starting value = m_initial		0	kg/h	
m_cond_final value = m_final		65	...upper limit is 65 kg/h	
Change these two values between 0 and 65 and click CommandButton1				
m_cond (kg/h)	h_vert (W/m^2.C)	Q (W)	T_s (deg.C)	
0	2093998.422	0.000	100.000	
8.125	10262.297	5126.234	95.005	
16.25	8717.986	10341.175	88.138	
24.375	7847.619	15668.487	80.034	
32.5	7210.868	21131.604	70.695	
40.625	6678.776	26760.700	59.932	
48.75	6205.622	32591.079	47.481	
56.875	5630.841	38753.608	31.176	
65	5001.528	45414.907	9.198	

And, the plot immediately changes as follows:

# Day one

## and you're ready

Day one. It's the moment you've been waiting for. When you prove your worth, meet new challenges, and go looking for the next one. It's when your dreams take shape. And your expectations can be exceeded. From the day you join us, we're committed to helping you achieve your potential. So, whether your career lies in assurance, tax, transaction, advisory or core business services, shouldn't your day one be at Ernst & Young?

**What's next for your future?**  
[ey.com/careers](http://ey.com/careers)

**ERNST & YOUNG**  
Quality In Everything We Do

© 2010 EYGM Limited. All Rights Reserved.

**Note:** While solving this problem, all the calculations have been done in the worksheet itself. So, values of all steps are seen transparently in the worksheet. For example, as the  $T_s$  changes how all values, including properties of Water, change can be seen in the worksheet.

**So, this worksheet can be used as Template for all such condensation calculations on a vertical plate.**

However, if we don't need all the intermediate values, it is better to write a VBA Function to do the calculations and return the desired final values only. This is demonstrated in the next problem:

=====

**Prob. 3.2.23.** Solve the above Problem in EXCEL using VBA Function written for the purpose:.

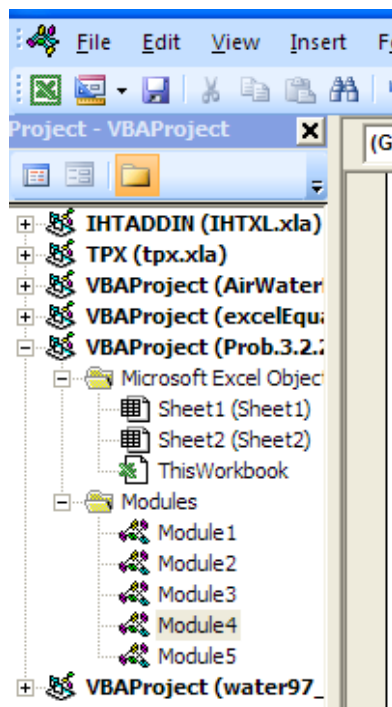

**EXCEL Solution:**

Let us write a VBA Function to do the calculations:

1. In the above Worksheet, go to: Developer – Visual Basic:

Click on Visual Basic, Select Module4:

And, type the following code:

```
Function Condensation_VPlate_Steam(T_sat As Double, T_s As Double, b As Double, L As Double) As Variant

'Condensation of Steam at T_sat on a Vertical Plate held at T_s

'Calculates h_avg for laminar, wavy and turbulent film condensation
'based on value of Re_f

'Note: positive x direction is from top of plate downwards; y dirn is from left to right
'x is the distance from top, b is the breadth of plate perpendicular to paper

Dim g As Double, Re As Double
Dim T_f As Double, h_fg As Double, rho_v As Double

Dim rho_l As Double, mu_l As Double, nu_l As Double, k_l As Double, cp_l As Double, Pr_l As Double
Dim h_fg_prime As Double, delta_l As Double, Re_f As Double, h_avg As Double
Dim Q As Double, m_condensed As Double

If T_sat <= T_s Then
MsgBox ("T_sat must be > T_s !")
End
End If

g = 9.81 '[m/s^2]
T_f = (T_sat + T_s) / 2 'Avg. temp.

'Properties of liquid at Tf:

rho_l = 1 / SatH2O_vf_T(T_f + 273.15)
mu_l = SatH2O_muf_T(T_f + 273.15)
cp_l = SatH2O_cpf_T(T_f + 273.15)
k_l = SatH2O_kf_T(T_f + 273.15)
nu_l = mu_l / rho_l
Pr_l = SatH2O_Prf_T(T_f + 273.15)

'Properties of vapour and h_fg at Tsat:

rho_v = 1 / SatH2O_vg_T(T_sat + 273.15)
h_fg = SatH2O_hfg_T(T_sat + 273.15)

'Calculations:

h_fg_prime = h_fg + 0.68 * cp_l * _
(T_sat - T_s) 'modified h_fg...takes care of nonlinear temp distribn and liq film subcooling"
delta_l = ((4 * k_l * mu_l * (T_sat - T_s) * L) / _
(rho_l * (rho_l - rho_v) * g * h_fg_prime)) ^ (1 / 4) '[m]...thickness of film at a
'distance L from top

Re = (4 * g * rho_l * (rho_l - rho_v) * delta_l ^ 3) / (3 * mu_l ^ 2) '...film Reynolds No.
```

```

If (Re > 0) And (Re <= 30) Then 'laminar film
    h_avg = 1.47 * k_l * Re ^ (-1 / 3) * (g / nu_l ^ 2) ^ (1 / 3)
    Re_f = Re 'Film Reynolds No. for laminar flow
ElseIf (Re > 30) And (Re <= 1800) Then 'wavy - laminar flow in film
    h_avg = ((Re * k_l) / (1.08 * Re ^ 1.22 - 5.2)) * (g / nu_l ^ 2) ^ (1 / 3)
    Re_f = (4.81 + (3.7 * L * k_l * (T_sat - T_s) / (mu_l * h_fg_prime)) * (g / nu_l ^ 2) ^ (1 / 3)) ^ 0.82
ElseIf (Re > 1800) Then 'turb. flow in film
    h_avg = ((Re * k_l) / (8750 + 58 * Pr_l ^ (-0.5) * (Re ^ 0.75 - 253))) * _
    (g / nu_l ^ 2) ^ (1 / 3)
    Re_f = ((0.069 * L * k_l * Pr_l ^ 0.5 * (T_sat - T_s) / (mu_l * h_fg_prime)) * _
    (g / nu_l ^ 2) ^ (1 / 3) - 151 * Pr_l ^ 0.5 + 253) ^ (4 / 3)

End If

Q = h_avg * (b * L) * (T_sat - T_s) 'W
m_condensed = Q / h_fg_prime 'kg/s
Condensation_VPlate_Steam = Application.Transpose(Array(delta_l, Re_f, h_avg, Q, m_condensed))

End Function
    
```

In the past four years we have drilled

# 81,000 km

That's more than **twice** around the world.

**Who are we?**  
We are the world's leading oilfield services company. Working globally—often in remote and challenging locations—we invent, design, engineer, manufacture, apply, and maintain technology to help customers find and produce oil and gas safely.

**Who are we looking for?**  
We offer countless opportunities in the following domains:

- Engineering, Research, and Operations
- Geoscience and Petrotechnical
- Commercial and Business

If you are a self-motivated graduate looking for a dynamic career, apply to join our team.

**What will you be?**

careers.slb.com

Click on the ad to read more

Note in the definition of the Function that:

**Inputs are:** T\_sat (Sat. temp.), T\_s (Surface temp.), b (Width of vertical plate) and L (height of vertical plate)

**Output of Function:** is a vertical array containing, in order: delta\_L (thickness of condensate at the bottom of plate), Re\_f (film Reynolds No.), h\_avg (avg. heat tr coeff. h\_vert), Q (heat transfer to the plate in Watts) and m\_condensed in kg/s

Now, this Function is available like any other built-in Function in EXCEL.

It is located under the ‘User Defined’ category.

Using the earlier Worksheet itself, where the data are entered and the cells are named, we have:

	A	B	C	D	E	F
209						
210		Data:	Fluid =	Water		
211		Surface temp	T_s	45.4235	C	
212		Sat. temp.	T_sat	100.0	C	
213		Avg. temp	T_f	72.7	C	
214		Height of plate	L	0.5	m	
215		Width of plate	B	0.2	m	
216		Inclination to vertical	theta	0.0	deg.	
217		Accn. due to gravity	g	9.810	m/s^2	
218						

$$T_f = (T_s + T_{sat}) / 2$$

Now, set up the worksheet with 5 consecutive cells in column C (i.e. cells C308 to C312) selected as shown:

	A	B	C	D
305				
306		Using the VBA Function for a vertical plate:		
307				
308		delta_L		m
309		Re_f		
310		h_avg		W/m^2.C
311		Q		Q
312		m_cond		kg/s
313		m_cond_per_hour		kg/h
314				

Now, with the range still selected, place the cursor in any cell between C308 and C312, and click on the 'Insert Function' symbol:

	A	B	C	D
305				
306		Using the VBA Function for a vertical plate:		
307				
308		delta_L		m
309		Re_f		
310		h_avg		W/m^2.C
311		Q		Q
312		m_cond		kg/s
313		m_cond_per_hour		kg/h
314				

Choose 'User Defined' category:

Click OK.

And, in 'Select a Function': click on the desired Function as shown:

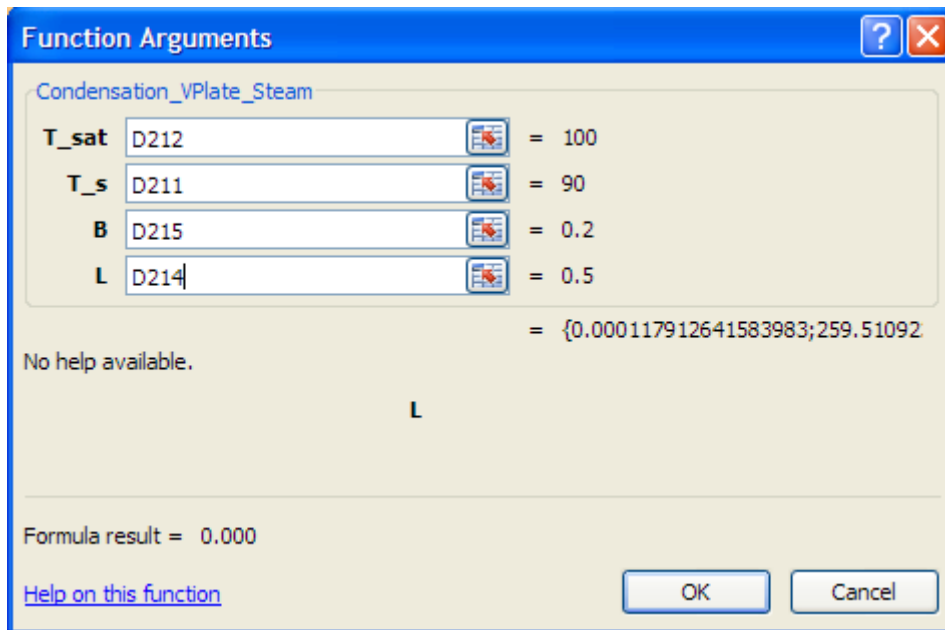

Hellmann's is one of Unilever's oldest brands having been popular for over 100 years. If you too share a passion for discovery and innovation we will give you the tools and opportunities to provide you with a challenging career. Are you a great scientist who would like to be at the forefront of scientific innovations and developments? Then you will enjoy a career within Unilever Research & Development. For challenging job opportunities, please visit [www.unilever.com/rjjobs](http://www.unilever.com/rjjobs).

Could it be  Unilever

Click OK. We get the following screen. Fill it up as shown:

**Important:** Now, keeping Ctrl+Shift pressed, click OK, since this is an Array Function (i.e. it returns an Array of values).

We get:

	A	B	C	D
305				
306		<b>Using the VBA Function for a vertical plate:</b>		
307				
308		delta_L	0.000	m
309		Re_f	259.511	
310		h_avg	9010.076	W/m^2.C
311		Q	9010.076	Q
312		m_cond	0.003942	kg/s
313		m_cond_per_hour		kg/h

Observe that all the 5 selected cells are filled with the respective values returned by the Function.

Last cell, ie. m\_cond\_per\_hour may now be calculated as:  $m\_cond\_per\_hour = m\_cond * 3600$ .

Finally, we have:

	A	B	C	D
305				
306	Using the VBA Function for a vertical plate:			
307				
308		delta_L	0.000	m
309		Re_f	259.511	
310		h_avg	9010.076	W/m^2.C
311		Q	9010.076	Q
312		m_cond	0.003942	kg/s
313		m_cond_per_hour	14.191	kg/h

**Note:** These values match with those obtained in the previous problem, as they should.

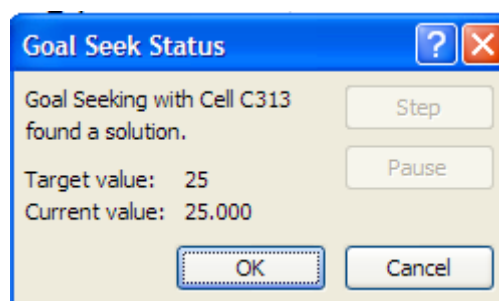

Now, if we have to find out the  $T_s$  required to get a condensation rate of 25 kg/h:

Apply Goal Seek to make cell C313 equal to 25 by changing cell D211 (i.e. value of  $T_s$ ).

Applying Goal Seek has been explained in the previous problem. We get:

Click OK. And we get:

And value of  $T_s$  can be seen in cell D211:

	A	B	C	D	E	F
209						
210		<b>Data:</b>	Fluid =	Water		
211		Surface temp	$T_s$	79.3601	C	
212		Sat. temp.	$T_{sat}$	100.0	C	$T_{mf} = (T_s + T_{sat}) / 2$
213		Avg. temp	$T_f$	89.7	C	
214		Height of plate	L	0.5	m	
215		Width of plate	B	0.2	m	
216		Inclination to vertical	theta	0.0	deg.	
217		Accn. due to gravity	g	9.810	m/s <sup>2</sup>	

i.e. Value of  $T_s$  required to get a condensation rate of 25 kg/h = 79.36 01deg. C .... Ans.

Again, this matches with the value obtained in the previous problem.

Thus, we see that using a custom-written VBA Function is advantageous and helps in solving the problems faster and accurately, without having to spend time in entering tedious equations in the cells.

Discover the truth at [www.deloitte.ca/careers](http://www.deloitte.ca/careers)

**Deloitte.**

© Deloitte & Touche LLP and affiliated entities.

Click on the ad to read more

**Prob. 3.2.24.** Sat.steam at 1 atm condenses on a 0.3 m high, 1 m wide vertical plate maintained at 90 C. Determine: (a) the thickness of film at the bottom of the plate,  $\delta_L$ , (b) film Reynolds No.  $Re_f$ , (c) heat transfer coeff.  $h_{avg}$ , (d) total heat transfer,  $Q$ , and (e) the condensation rate.

Also, plot the condensation rate for various values of  $T_s$  ranging from  $T_s = 50$  C to 90 C.

**EXCEL Solution:**

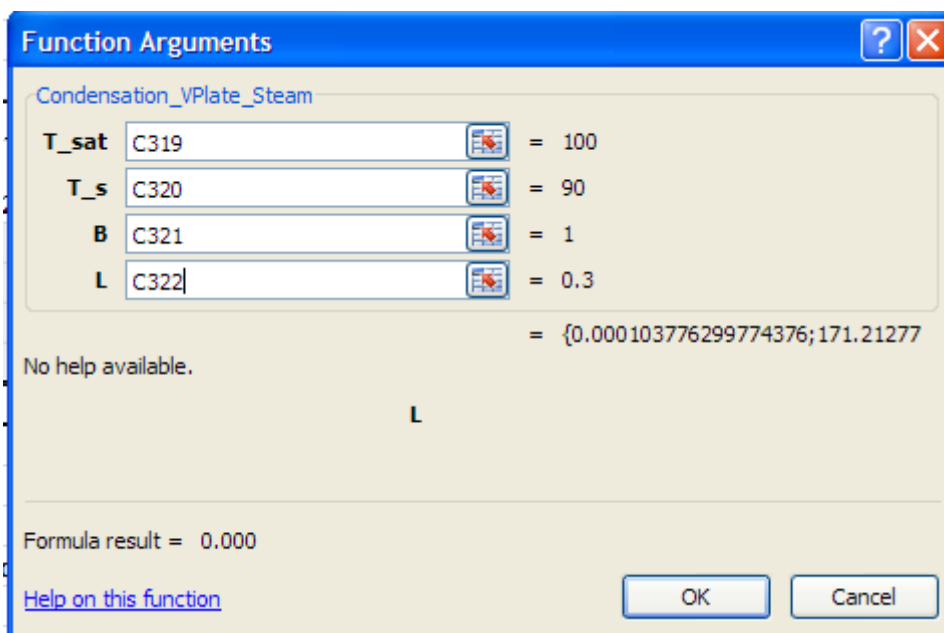

Use the VBA Function for Vertical plate written earlier:

Following are the steps:

1. Set up the worksheet, enter data:

	A	B	C	
318		<b>Data:</b>		
319		T_sat	100.000	C
320		T_s	90.000	C
321		b	1.000	m
322		L	0.300	m

2. Select 5 consecutive cells in column and enter the VBA Function for Condensation on vertical plate as explained in the previous problem.
3. Fill up the arguments of the Function as shown:

Press (Ctrl + Shift + Enter), since it is an Array Function.

Results desired are displayed immediately in the selected cells:

	A	B	C	D
318		Data:		
319		T_sat	100.000	C
320		T_s	90.000	C
321		b	1.000	m
322		L	0.300	m
323				
324		delta_L	0.0001038	m
325		Re_f	171.213	
326		h_avg	9840.315	W/m^2.C
327		Q	29520.944	W
328		m_cond	0.012916	kg/s
329		m_cond_per_hour		kg/h
330				

4. Now, convert m\_cond to m\_cond\_per\_hour by multiplying by 3600:

C329      fx      =C328\*3600

	A	B	C	D
318		Data:		
319		T_sat	100.000	C
320		T_s	90.000	C
321		b	1.000	m
322		L	0.300	m
323				
324		delta_L	0.0001038	m
325		Re_f	171.213	
326		h_avg	9840.315	W/m^2.C
327		Q	29520.944	W
328		m_cond	0.012916	kg/s
329		m_cond_per_hour	46.497	kg/h

Thus:

Condensation rate is: 46.497 kg/h .... Ans.

To plot m\_cond against T\_s:

Let us write a VBA program to do this.

1. Before that, set up a Table as shown:

We plan to give lower limit and upper limit of  $T_s$ , and then the program should fill up the Table for 10 equally divided values of  $T_s$  and also the program should be executed with a `ControlButton`.

For the procedure of inserting an ActiveX `ControlButton`, see the previous problem.

330				
331				
332	To plot $h_{avg}$ , $Q$ and $m_{cond}$ against $T_s$ :			
333				CommandButton2
334	$T_s$ lower=	40	C	
335	$T_s$ higher=	90		
336	Change these two values between 0 and 90 and click CommandButton2			
337				
338	$T_s$ (deg.C)	$h_{avg}$ (W.m <sup>2</sup> .C)	$Q$ (W)	$m_{cond}$ per hour (kg/h)
339				
340				
341				
342				
343				
344				
345				
346				
347				
348				
349				

# Grant Thornton—<sup>REALLY</sup> a great place to work.

We're proud to have been recognized as one of Canada's Best Workplaces by the Great Place to Work Institute™ for the last four years. In 2011 Grant Thornton LLP was ranked as the fifth Best Workplace in Canada, for companies with more than 1,000 employees. We are also very proud to be recognized as one of Canada's top 25 Best Workplaces for Women and as one of Canada's Top Campus Employers.

Priyanka Sawant  
Manager

Audit • Tax • Advisory

2. Now, double click on the ControlButton2 and we see the VBA program behind it:

```
Private Sub CommandButton2_Click()  
|  
End Sub
```

3. Now, modify this program as follows to perform the desired calculation steps:

```
Private Sub CommandButton2_Click()  
  
Dim i As Integer  
Dim T_s_initial As Double, T_s_final As Double, Inc As Double  
  
T_s_initial = Range("C334") 'starting value for T_s  
T_s_final = Range("C335") 'starting value for T_s  
  
Inc = (T_s_final - T_s_initial) / 10  
  
For i = 0 To 10  
  
Range("C320") = T_s_initial + i * Inc 'Sets the T_s value to the starting or initial value  
  
'Immediately, all other values will up-date themselves.  
'And, copy them to their respective places in the Table:  
  
Cells(339 + i, 2) = Range("C320") 'copies value of T_s to Table  
Cells(339 + i, 3) = Range("C326") 'copies value of h_avg to Table  
Cells(339 + i, 4) = Range("C327") 'copies value of Q to Table  
Cells(339 + i, 5) = Range("C329") 'copies value of m_cond_per_hour to Table  
  
Next i  
  
End Sub
```

Read the comments in the above code to know what each line does.

4. Now, click on the CommandButton2 and immediately the calculations are done and the Table is filled up:

	A	B	C	D	E
330					
331					
332		To plot h_avg, Q and m_cond against T_s:			
333					CommandButton2
334		T_s_lower=	40	C	
335		T_s_higher=	90		
336		Change these two values between 0 and 90 and click CommandButton2			
337					
338		<b>T_s (deg.C)</b>	<b>h_avg (W.m<sup>2</sup>.C)</b>	<b>Q (W)</b>	<b>m_cond_per_hour (kg/h)</b>
339		40	6470.780	116474.047	172.700
340		45	6673.633	110114.948	164.231
341		50	6852.391	102785.871	154.206
342		55	7052.117	95203.579	143.680
343		60	7279.946	87359.347	132.632
344		65	7534.148	79108.556	120.830
345		70	7815.814	70342.327	108.094
346		75	8148.413	61113.096	94.486
347		80	8553.905	51323.430	79.839
348		85	9081.401	40866.307	63.966
349		90	9840.315	29520.944	46.497

5. Now, plot m\_cond against T\_s:

6. Now, we can easily change the range of  $T_s$  as we desire, by changing cells C334 and C335. As an example, for  $T_s$  between the limits 10 and 60 C: Change cells C344 and C335 as shown and click CommandButton2 and we get:

	A	B	C	D	E
331					
332		To plot $h_{avg}$ , Q and $m_{cond}$ against $T_s$ :			
333					CommandButton2
334		$T_{s\_lower} =$	10	C	
335		$T_{s\_higher} =$	60		
336		Change these two values between 0 and 90 and click CommandButton2			
337					
338		$T_s$ (deg.C)	$h_{avg}$ (W.m <sup>2</sup> .C)	Q (W)	$m_{cond\_per\_hour}$ (kg/h)
339		10	5470.928	147715.068	211.608
340		15	5616.357	143217.103	206.328
341		20	5770.951	138502.813	200.674
342		25	5932.619	133483.928	194.512
343		30	6093.910	127972.119	187.557

Engineering the Future – since 1758.

## MAN Diesel & Turbo

And, the plot up-dates itself immediately:

=====  
**Prob.3.2.25.** Consider a vertical tube, 1 m high, 80 mm dia, maintained at a uniform temp of 50 C, exposed to sat. steam at atm. pressure. Find out the heat transfer and steam condensation rate.

Note: This is the same as Prob.3.2.5, which was solved with Mathcad.

Now, we shall solve it with EXCEL.

**EXCEL Solution:**

This is the case of condensation of steam on a vertical cylinder.

Equations for the case of a vertical cylinder are the same as those for a vertical plate, if the Dia of the cylinder is much larger than the thickness of condensate film, which is generally true. Only change is in calculation of Q where the surface area for cylinder is:  $\pi \cdot D \cdot L$ :

**First, let us write a VBA Function for the cases of: condensation of steam on a Vertical Cylinder:**

.....

```

Function Condensation_VCyl_Steam(T_sat As Double, T_s As Double, D As Double, L As Double) As Variant

'Condensation of Steam at T_sat on a Vertical Cylinder held at T_s

'This is the same as for vertical plates, when the cyl dia is large...
'relative to the thickness of the liquid film (which is generally true)

'Calculates h_avg for laminar, wavy and turbulent film condensation
'based on value of Re_f

'Results are returned as an Array

'Note: positive x direction is from top of plate downwards; y dirn is from left to right
'x is the distance from top, b is the breadth of plate perpendicular to paper

Dim g As Double, Re As Double
Dim T_f As Double, h_fg As Double, rho_v As Double

Dim rho_l As Double, mu_l As Double, nu_l As Double, k_l As Double, cp_l As Double, Pr_l As Double
Dim h_fg_prime As Double, delta_l As Double, Re_f As Double, h_avg As Double
Dim Q As Double, m_condensed As Double

If T_sat <= T_s Then
  MsgBox ("T_sat must be > T_s !")
End
End If

g = 9.81 '[m/s^2]
T_f = (T_sat + T_s) / 2 'Avg. temp.

'Properties of liquid at Tf:

rho_l = 1 / SatH2O_vf_T(T_f + 273.15)
mu_l = SatH2O_muf_T(T_f + 273.15)
cp_l = SatH2O_cpf_T(T_f + 273.15)
k_l = SatH2O_kf_T(T_f + 273.15)
nu_l = mu_l / rho_l
Pr_l = SatH2O_Prf_T(T_f + 273.15)

'Properties of vapour and h_fg at Tsat:

rho_v = 1 / SatH2O_vg_T(T_sat + 273.15)
h_fg = SatH2O_hfg_T(T_sat + 273.15)

```

```
'Calculations:
h_fg_prime = h_fg + 0.68 * cp_l * _
(T_sat - T_s) 'modified h_fg...takes care of nonlinear temp distribn and liq film subcooling"
delta_l = ((4 * k_l * mu_l * (T_sat - T_s) * L) / _
(rho_l * (rho_l - rho_v) * g * h_fg_prime)) ^ (1 / 4) '[m]....thickness of film at a
'distance L from top

Re = (4 * g * rho_l * (rho_l - rho_v) * delta_l ^ 3) / (3 * mu_l ^ 2) '...film Reynolds No.

If (Re > 0) And (Re <= 30) Then 'laminar film

    h_avg = 1.47 * k_l * Re ^ (-1 / 3) * (g / nu_l ^ 2) ^ (1 / 3)

    Re_f = Re 'Film Reynolds No. for laminar flow

ElseIf (Re > 30) And (Re <= 1800) Then 'wavy - laminar flow in film

    h_avg = ((Re * k_l) / (1.08 * Re ^ 1.22 - 5.2)) * (g / nu_l ^ 2) ^ (1 / 3)

    Re_f = (4.81 + (3.7 * L * k_l * (T_sat - T_s) / (mu_l * h_fg_prime)) * (g / nu_l ^ 2) ^ (1 / 3)) ^ 0.82

ElseIf (Re > 1800) Then 'turb. flow in film

    h_avg = ((Re * k_l) / (8750 + 58 * Pr_l ^ (-0.5) * (Re ^ 0.75 - 253))) * _
    (g / nu_l ^ 2) ^ (1 / 3)

    Re_f = ((0.069 * L * k_l * Pr_l ^ 0.5 * (T_sat - T_s) / (mu_l * h_fg_prime)) * _
    (g / nu_l ^ 2) ^ (1 / 3) - 151 * Pr_l ^ 0.5 + 253) ^ (4 / 3)

End If
```

# CAREER KICKSTART

An app to keep you in the know

Whether you're a graduate, school leaver or student, it's a difficult time to start your career. So here at RBS, we're providing a helping hand with our new Facebook app. Bringing together the most relevant and useful careers information, we've created a one-stop shop designed to help you get on the career ladder – whatever your level of education, degree subject or work experience.

And it's not just finance-focused either. That's because it's not about us. It's about you. So download the app and you'll get everything you need to know to kickstart your career.

So what are you waiting for?

Click [here](#) to get started.

Click on the ad to read more

```

Q = h_avg * (Application.Pi() * D * L) * (T_sat - T_s) 'W
m_condensed = Q / h_fg_prime 'kg/s
Condensation_VCyl_Steam = Application.Transpose(Array(delta_l, Re_f, h_avg, Q, m_condensed))
End Function

```

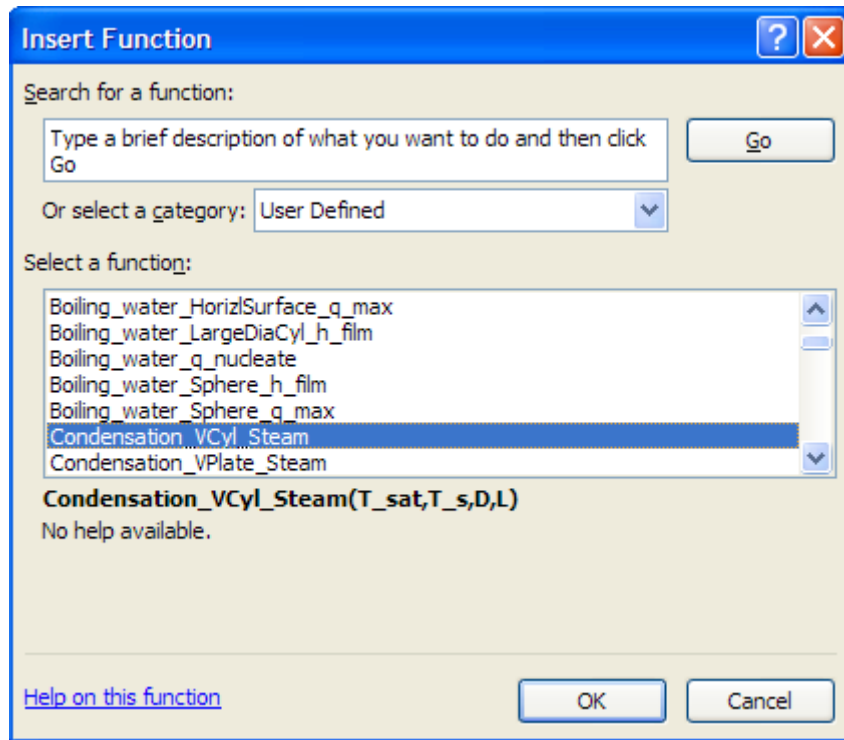

Now, let us solve the above problem.

Remember that the Function returns an Array containing: delta\_L, Re\_f, h\_avg, Q and m\_cond as earlier.

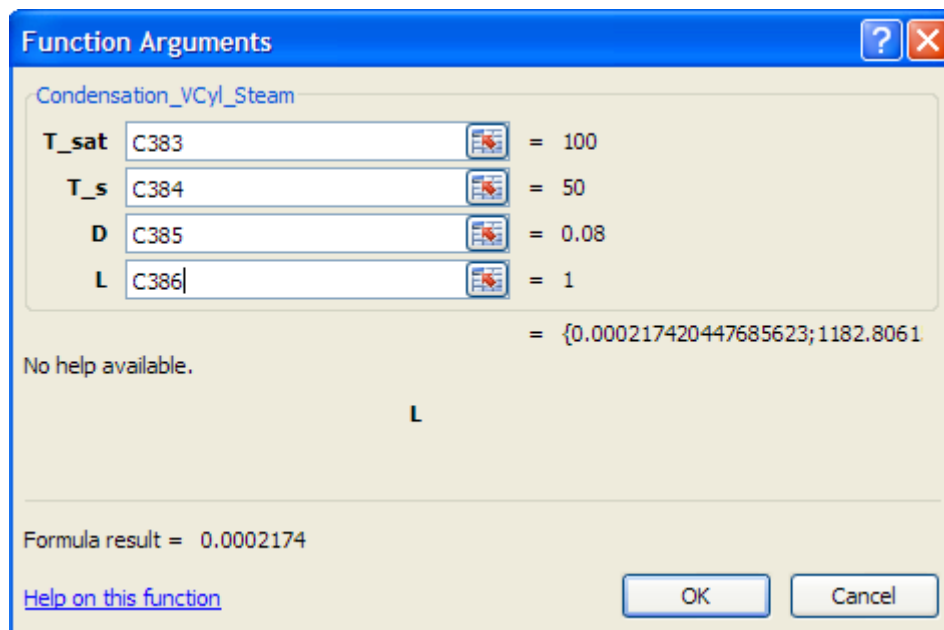

1. Set up the EXCEL worksheet, enter data:

	A	B	C	D
381				
382		Data:		
383		T_sat	100.000	C
384		T_s	50.000	C
385		D	0.080	m
386		L	1.000	m
387				
388		delta_L		m
389		Re_f		
390		h_avg		W/m^2.C
391		Q		W
392		m_cond		kg/s
393		m_cond_per_hour		kg/h

- Now, **select the 5 consecutive cells** (i.e. cells C388 to C392) and enter the array Function for condensation of steam on Vertical cylinder: (See the previous problem for procedure of inserting a ‘built-in’ Function):

Click OK. Fill up the screen that shows up as follows:

**Now, IMPORTANT:** Press (Ctrl + Shift + Return or OK), since it is an Array Function. We get the results as shown below:

	A	B	C	D
381				
382		Data:		
383		T_sat	100.000	C
384		T_s	50.000	C
385		D	0.080	m
386		L	1.000	m
387				
388		delta_L	0.0002174	m
389		Re_f	1182.806	
390		h_avg	5604.515	W/m^2.C
391		Q	70428.408	W
392		m_cond	0.029350	kg/s
393		m_cond_per_hour		kg/h

In the above, the Function entered can be seen in the Formula bar.

# ORACLE®

**Be BRAVE**

***enough to reach for the sky***

Oracle's business is information - how to manage it, use it, share it, protect it. Oracle is the name behind most of today's most innovative and successful organisations.

Oracle continuously offers international opportunities to top-level graduates, mainly in our Sales, Consulting and Support teams.

If you want to join a company that will invest in your future, Oracle is the company for you to drive your career!

<https://campus.oracle.com>

**ORACLE IS THE INFORMATION COMPANY**

Click on the ad to read more

Complete the last step by calculating  $m_{\text{cond}}$  per hour by multiplying the value in cell C392 by 3600. We get:

	A	B	C	D
381				
382		Data:		
383		T_sat	100.000	C
384		T_s	50.000	C
385		D	0.080	m
386		L	1.000	m
387				
388		delta_L	0.0002174	m
389		Re_f	1182.806	
390		h_avg	5604.515	W/m^2.C
391		Q	70428.408	W
392		m_cond	0.029350	kg/s
393		m_cond_per_hour	105.661	kg/h

Thus:

The condensation rate is: 105.661 kg/h ... Ans.

Note: This matches with the results obtained in Prob. 3.2.5.

(b) What should be the value of  $T_s$  to get a condensation rate of 125 kg/h?

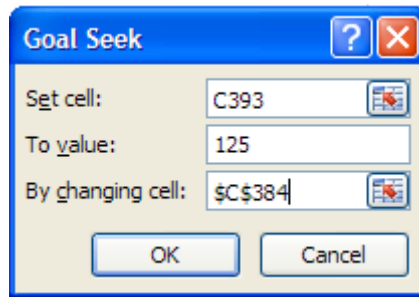

This is calculated by applying Goal Seek on cell C393 to make it 125 by changing cell C384 (i.e.value of  $T_s$ ):

Following are the steps:

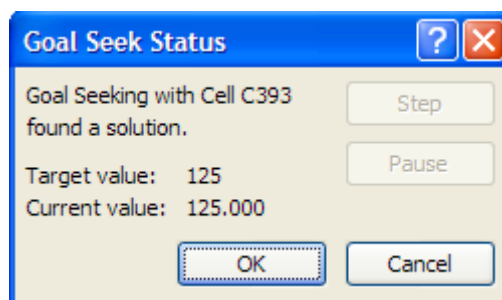

Go to Data – WhatIf Analysis – Goal Seek:

Click on Goal Seek. Fill up the screen that pops up as shown:

Click OK:

i.e. Goal Seek has found a solution. Click OK and see the value in cell C384 to get the required  $T_s$ :

	A	B	C	D
381				
382		Data:		
383		T_sat	100.000	C
384		T_s	33.526	C
385		D	0.080	m
386		L	1.000	m
387				
388		delta_L	0.0002380	m
389		Re_f	1242.837	
390		h_avg	5084.249	W/m <sup>2</sup> .C
391		Q	84941.168	W
392		m_cond	0.034722	kg/s
393		m_cond_per_hour	125.000	kg/h

i.e. Value of  $T_s$  required to get a condensation rate of 125 kg/h is: 33.53 C ... Ans.

**Note:** Values of delta\_L, Re\_f, h\_avg, and Q also have got up-dated immediately.

=====

**Prob.3.2.26.** Consider a horizontal tube, 1 m long, 50 mm dia, maintained at a uniform temp of 34 C, exposed to sat. steam at 0.2 bar. pressure. Find out the heat transfer and steam condensation rate.

**EXCEL Solution:**

Note that at 0.2 bar, sat. temp.  $T_{sat} = 60.06$  C

Let us write a VBA Function to calculate h, Q and m\_condensed for condensation of steam on a Horizl cylinder:

```
Function Condensation_on_HCyl_Steam(T_sat As Double, T_s As Double, D As Double, L As Double) As Variant
'Condensation of Steam at T_sat on a Horizl Cylinder held at T_s
'Input: T_sat, T_s (C), D, L (m)
'Output: h_avg (W/m^2.C), Q (W) and mass_condensed (kg/s)
'Results are returned as an Array

Dim g As Double
Dim T_f As Double, h_fg As Double, rho_v As Double

Dim rho_l As Double, mu_l As Double, nu_l As Double, k_l As Double, cp_l As Double, Pr_l As Double
Dim h_fg_prime As Double, h_avg As Double
Dim Q As Double, m_condensed As Double

If T_sat <= T_s Then
MsgBox ("T_sat must be > T_s !")
End
End If

g = 9.81 '[m/s^2]
T_f = (T_sat + T_s) / 2 'Avg. temp.

'Properties of liquid at Tf:

rho_l = 1 / SatH2O_vf_T(T_f + 273.15)
mu_l = SatH2O_muf_T(T_f + 273.15)
cp_l = SatH2O_cpf_T(T_f + 273.15)
k_l = SatH2O_kf_T(T_f + 273.15)
nu_l = mu_l / rho_l
Pr_l = SatH2O_Prf_T(T_f + 273.15)

'Properties of vapour and h_fg at Tsat:

rho_v = 1 / SatH2O_vg_T(T_sat + 273.15)
h_fg = SatH2O_hfg_T(T_sat + 273.15)
```

```
'Calculations:

h_fg_prime = h_fg + 0.68 * cp_l * _
(T_sat - T_s) 'modified h_fg....takes care of nonlinear temp distribn and liq film subcooling

h_avg = 0.729 * ((g * rho_l * (rho_l - rho_v) * h_fg_prime * k_l ^ 3) / _
(mu_l * (T_sat - T_s) * D)) ^ (1 / 4) '[W/m^2-C] .... avg heat tr coeff over L

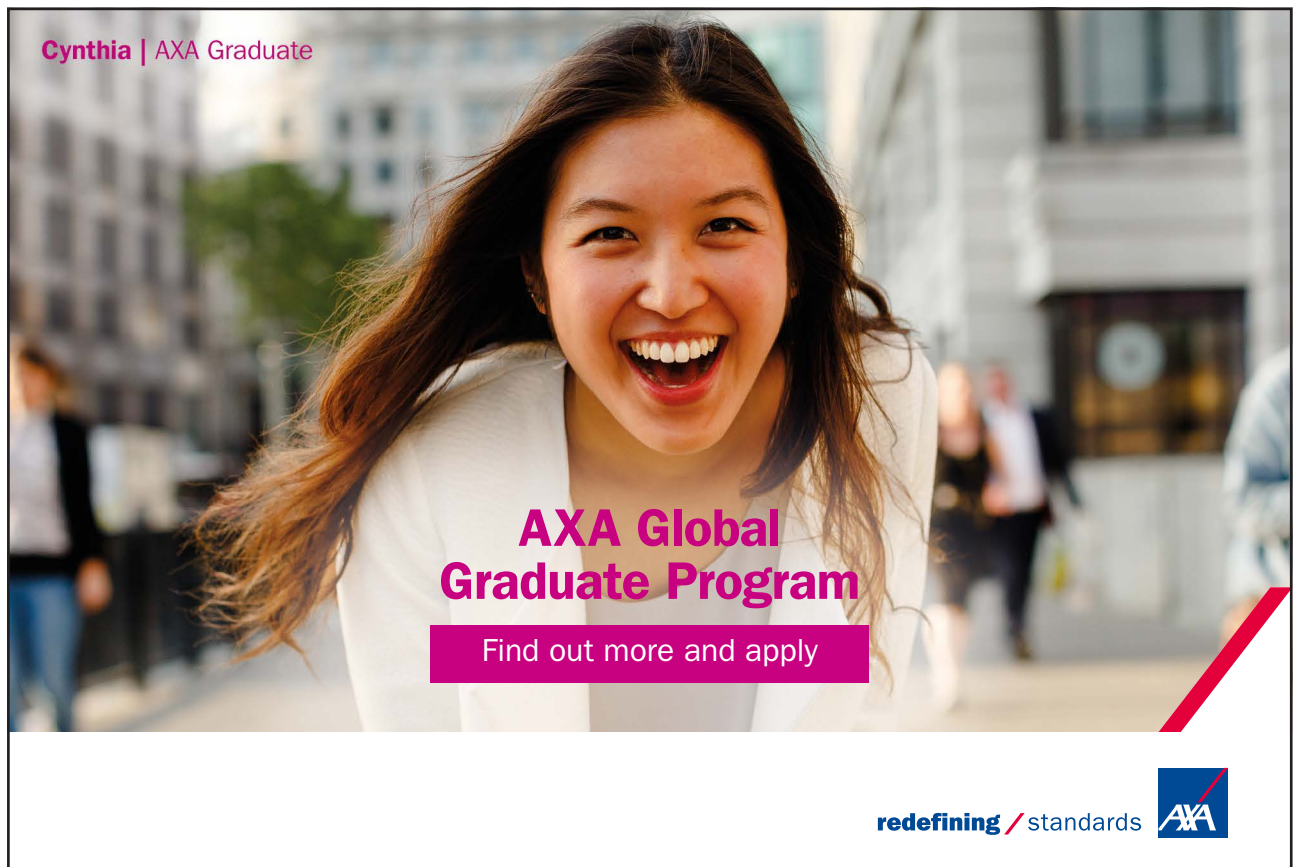

Q = h_avg * (Application.Pi() * D * L) * (T_sat - T_s) 'W

m_condensed = Q / h_fg_prime 'kg/s

Condensation_on_HCyl_Steam = Application.Transpose(Array(h_avg, Q, m_condensed))

End Function
```

Read the comments in the above program to know what each line does.

Cynthia | AXA Graduate

**AXA Global Graduate Program**

Find out more and apply

redefining / standards AXA

Now, let us use this program to solve the above problem:

Following are the steps:

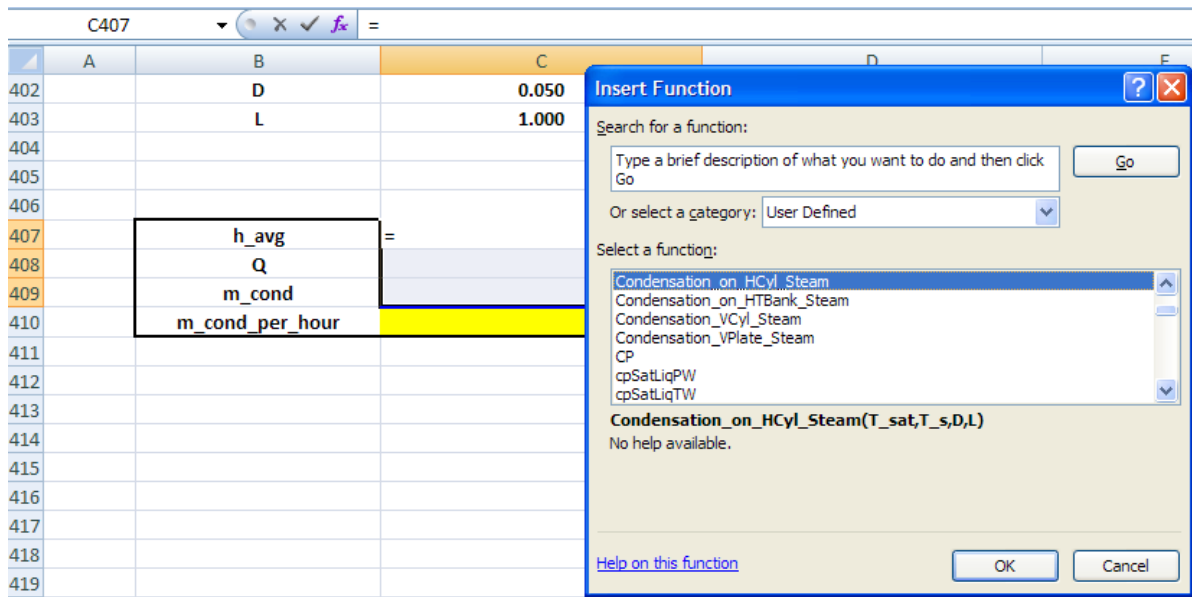

1. Set up the EXCEL worksheet, enter data:

	A	B	C
399		Data:	
400		T_sat	60.060 C
401		T_s	34.000 C
402		D	0.050 m
403		L	1.000 m

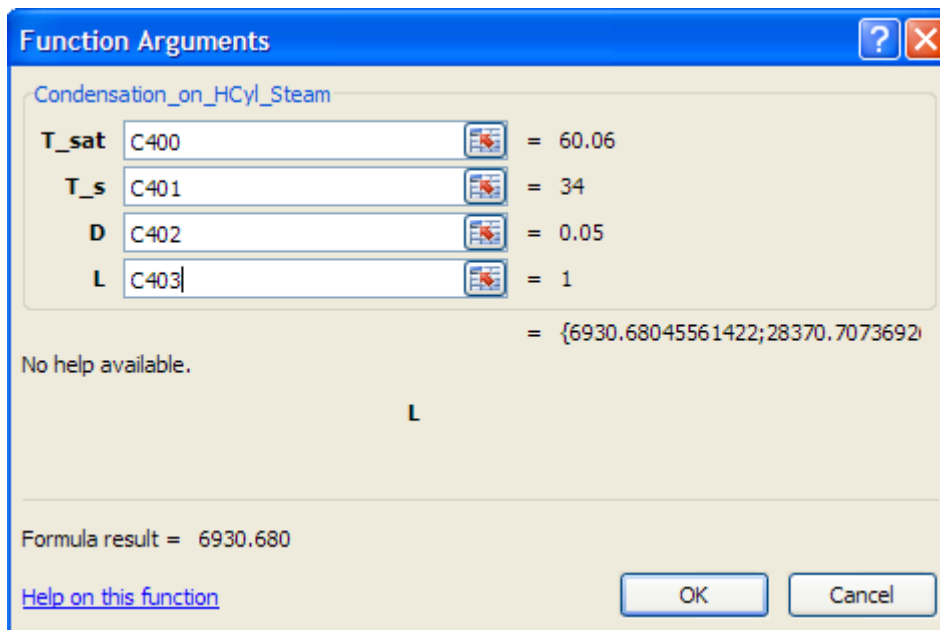

2. Set up the worksheet for further calculation, remembering that we are going to use an Array Function:

	A	B	C	D
399		Data:		
400		T_sat	60.060	C
401		T_s	34.000	C
402		D	0.050	m
403		L	1.000	m
404				
405				
406				
407		h_avg		W/m^2.C
408		Q		W
409		m_cond		kg/s
410		m_cond_per_hour		kg/h

- Now, select three consecutive cells in column C, i.e. cells C407, C408 and C409, and insert the array Function:

- Press OK. We get the following screen; fill it up as shown:

5. **IMPORTANT:** Now, apply (Ctrl + Shift + Return), since it is an Array Function. We get:

C407      fx {=Condensation\_on\_HCyl\_Steam(C400,C401,C402,C403)}

	A	B	C	D
399		Data:		
400		T_sat	60.060	C
401		T_s	34.000	C
402		D	0.050	m
403		L	1.000	m
404				
405				
406				
407		h_avg	6930.680	W/m^2.C
408		Q	28370.707	W
409		m_cond	0.011664	kg/s
410		m_cond_per_hour		kg/h

In the Formula bar, see the Array Function used for Condensation on Horizl cylinder.

### Masters in Management

Designed for high-achieving graduates across all disciplines, London Business School's Masters in Management provides specific and tangible foundations for a successful career in business.

This 12-month, full-time programme is a business qualification with impact. In 2010, our MiM employment rate was 95% within 3 months of graduation\*; the majority of graduates choosing to work in consulting or financial services.

As well as a renowned qualification from a world-class business school, you also gain access to the School's network of more than 34,000 global alumni – a community that offers support and opportunities throughout your career.

For more information visit [www.london.edu/mm](http://www.london.edu/mm), email [mim@london.edu](mailto:mim@london.edu) or give us a call on +44 (0)20 7000 7573.

\* Figures taken from London Business School's Masters in Management 2010 employment report

Click on the ad to read more

6. Complete the last step to get condensation rate in kg/h in cell C410, by multiplying value in cell C409 by 3600:

	A	B	C	D
399		<b>Data:</b>		
400		T_sat	60.060	C
401		T_s	34.000	C
402		D	0.050	m
403		L	1.000	m
404				
405				
406				
407		h_avg	6930.680	W/m^2.C
408		Q	28370.707	W
409		m_cond	0.011664	kg/s
410		m_cond_per_hour	41.990	kg/h

Thus:

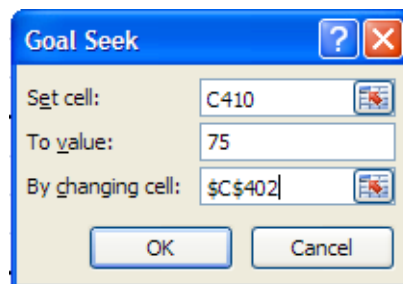

Heat transfer,  $q = 28370.7 \text{ W}$  ... ans.

Condensation rate =  $41.99 \text{ kg/h}$  .... Ans.

- (b) What diameter is required to get a condensation rate of  $75 \text{ kg/h}$ ?

Use Goal Seek in EXCEL to make cell C410 to 75 by changing cell C402 (i.e. value of D):

Click on: Data – WhatIf Analysis\_GoalSeek. We get the following screen; fill it up as shown:

Click OK:

Goal seek has found a solution. Again, click OK and see the new value of D in cell C402:

C402		fx 0.108358014587117	
A	B	C	D
399	Data:		
400	T_sat	60.060	C
401	T_s	34.000	C
402	D	0.108	m
403	L	1.000	m
404			
405			
406			
407	h_avg	5712.196	W/m^2.C
408	Q	50674.380	W
409	m_cond	0.020833	kg/s
410	m_cond_per_hour	75.000	kg/h

Thus:

Dia required to get 75 kg/h of condensation rate is:  $D = 0.108 \text{ m} \dots \text{Ans.}$

=====

Practically, the case of condensation on a bank of horizontal tubes in a vertical tier is more important than condensation on a single tube.

This is particularly relevant to Steam condensers where there are many columns (or Tiers), each Tier having many horizontal tubes, on which steam will condense at the condenser pressure.

**Let us write a VBA Function for the case of condensation of steam on a Tier of horizontal tubes:**

```

Function Condensation_on_HTBank_Steam(T_sat As Double, T_s As Double, D As Double, L As Double, _
N As Double, N_total As Double) As Variant

'Condensation of Steam at T_sat on a Horizl Tube Bank held at T_s
'i.e. A vertical Tier of N horizl tubes

'Input: T_sat, T_s (C), D, L (m), N (no. of tubes per Tier), N_total (total no. of
'tubes in all Tiers)

'Output: h_avg (W/m^2.C), Q (W) and mass_condensed (kg/s)

'Results are returned as an Array

Dim g As Double
Dim T_f As Double, h_fg As Double, rho_v As Double

Dim rho_l As Double, mu_l As Double, nu_l As Double, k_l As Double, cp_l As Double, Pr_l As Double
Dim h_fg_prime As Double, h_avg As Double
Dim Q As Double, m_condensed As Double

If T_sat <= T_s Then
  MsgBox ("T_sat must be > T_s !")
  End
End If

g = 9.81 '[m/s^2]
T_f = (T_sat + T_s) / 2 'Avg. temp.

'Properties of liquid at Tf:

rho_l = 1 / SatH2O_vf_T(T_f + 273.15)
mu_l = SatH2O_muf_T(T_f + 273.15)
cp_l = SatH2O_cpf_T(T_f + 273.15)
k_l = SatH2O_kf_T(T_f + 273.15)
nu_l = mu_l / rho_l
Pr_l = SatH2O_Prf_T(T_f + 273.15)

'Properties of vapour and h_fg at Tsat:

rho_v = 1 / SatH2O_vg_T(T_sat + 273.15)
h_fg = SatH2O_hfg_T(T_sat + 273.15)

'Calculations:

h_fg_prime = h_fg + 0.68 * cp_l * _
(T_sat - T_s) 'modified h_fg....takes care of nonlinear temp distribn and liq film subcooling

h_avg = 0.729 * ((g * rho_l * (rho_l - rho_v) * h_fg_prime * k_l ^ 3) / _
(mu_l * (T_sat - T_s) * N * D)) ^ (1 / 4) '[W/m^2-C] .... avg heat tr coeff over L

Q = h_avg * N_total * (Application.Pi() * D * L) * (T_sat - T_s) 'W

m_condensed = Q / h_fg_prime 'kg/s

Condensation_on_HTBank_Steam = Application.Transpose(Array(h_avg, Q, m_condensed))

End Function

```

Now, use this Function to solve the following problem:

**Problem 3.2.27.** Consider a one-pass Condenser which has a total of 64 tubes, arranged in a square array. Tubes are 1.25 m long, 12 mm OD. Water flowing inside the tubes maintains the wall temp at 25 C. If the steam is condensing on the outside of tubes at 0.1 bar pressure, find: (i) the heat transfer (ii) the condensation rate.

**EXCEL Solution:**

We have, at 0.1 bar:  $T_{sat} = 45.81$  C, and,  $T_s = 25$  C.

Since it is a square array, there are 8 Tiers, each Tier having 8 horizontal tubes. i.e.  $N = 8$ ,  $N_{total} = 64$

[www.surrey.ac.uk/downloads](http://www.surrey.ac.uk/downloads)

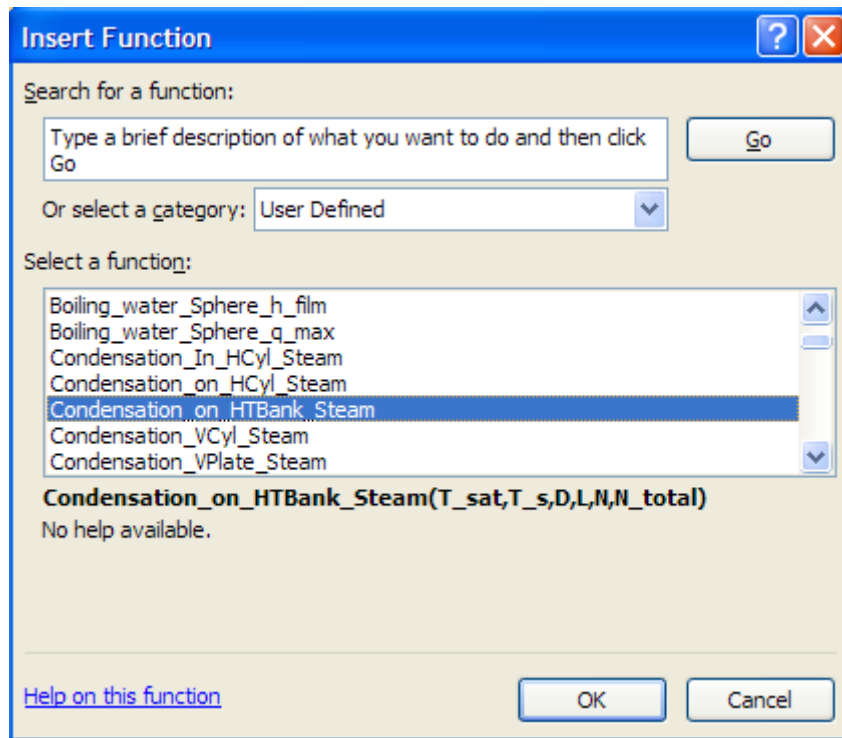

1. Set up the EXCEL worksheet, enter data:

C423		fx		64
	A	B	C	
417		Data:		
418		T_sat	45.810	C
419		T_s	25.000	C
420		D	0.012	m
421		L	1.250	m
422		N	8	
423		N_total	64	

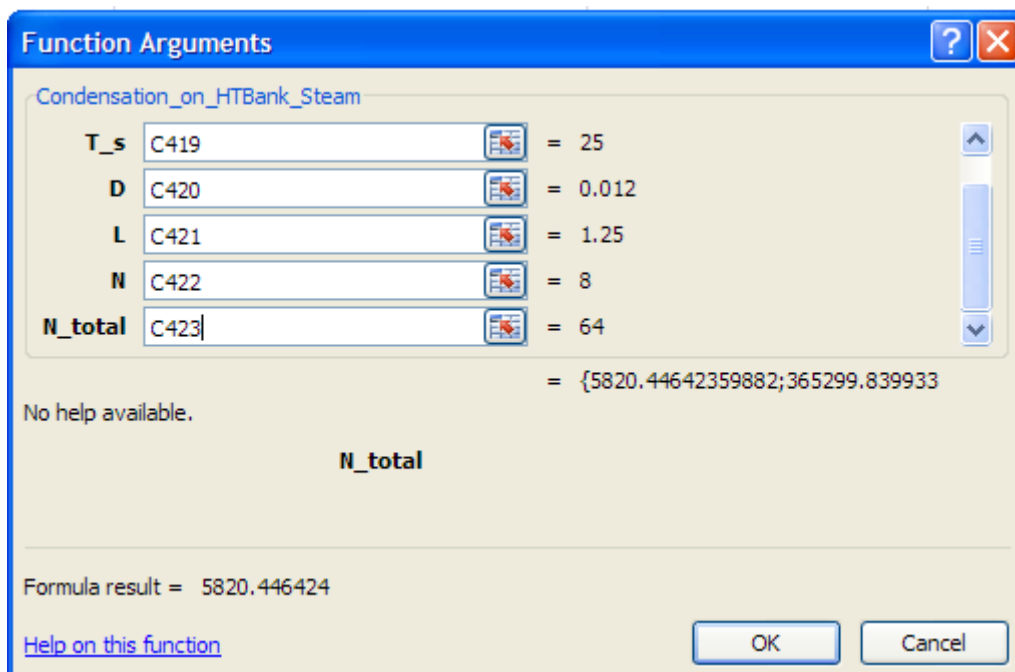

2. Set up the calculations for the Tube Bank, using the Array Function just written:

C428		fx		=C427*3600
	A	B	C	D
417		Data:		
418		T_sat	45.810	C
419		T_s	25.000	C
420		D	0.012	m
421		L	1.250	m
422		N	8	
423		N_total	64	
424				
425		h_avg		W/m^2.C
426		Q		W
427		m_cond		kg/s
428		m_cond_per_hour	0.000	kg/h

3. Select the cells C425, C426 and C427 and enter the Array Function:

Click OK. We get the following screen; fill it up as shown:

**IMPORTANT:** Now, press (Ctrl + Shift + Enter), since it is an Array Function. We get:

	A	B	C	D
417		Data:		
418		T_sat	45.810	C
419		T_s	25.000	C
420		D	0.012	m
421		L	1.250	m
422		N	8	
423		N_total	64	
424				
425		h_avg	5820.446424	W/m^2.C
426		Q	365299.839933	W
427		m_cond	0.149004	kg/s
428		m_cond_per_hour	536.413	kg/h

Thus:

Heat transferred,  $Q = 365299.84 \text{ W}$  .... Ans.

Condensation rate =  $536.413 \text{ kg/h}$  ... Ans.

**(b) For  $T_s$  varying from 15 C to 36 C, plot the condensation rate against  $T_s$ :**

Let us write a VBA program to do this.

1. Before that, set up a Table as shown:

We plan to give lower limit and upper limit of  $T_s$ , and then the program should fill up the Table for 7 equally divided values of  $T_s$  and also the program should be executed with a ControlButton.

For the procedure of inserting an ActiveX ControlButton, see Problem 3.2.22.

	A	B	C	D	E
432		<b>To plot <math>h_{avg}</math>, Q and <math>m_{cond}</math> against <math>T_s</math>:</b>			
433					
434		$T_s$ lower=	15	C	
435		$T_s$ higher=	36	C	CommandButton3
436		<b>Change these two values between 10 and 45 and click CommandButton2</b>			
437					
438		$T_s$ (deg.C)	$h_{avg}$ (W.m <sup>2</sup> .C)	Q (W)	$m_{cond\_per\_hour}$ (kg/h)
439					
440					
441					
442					
443					
444					
445					
446					

2. Now, double click on the ControlButton3 and we see the VBA program behind it:

Private Sub CommandButton3\_Click()

End Sub

3. Now, modify this program as follows to perform the desired calculation steps:

```
Private Sub CommandButton3_Click()

Dim i As Integer
Dim T_s_initial As Double, T_s_final As Double, Inc As Double

T_s_initial = Range("C434") 'starting value for T_s
T_s_final = Range("C435") 'starting value for T_s

Inc = (T_s_final - T_s_initial) / 7

For i = 0 To 7

Range("C419") = T_s_initial + i * Inc 'Sets the T_s value to the starting or initial value

'Immediately, all other values will up-date themselves.
'And, copy them to their respective places in the Table:

Cells(439 + i, 2) = Range("C419") 'copies value of T_s to Table
Cells(439 + i, 3) = Range("C425") 'copies value of h_avg to Table
Cells(439 + i, 4) = Range("C426") 'copies value of Q to Table
Cells(439 + i, 5) = Range("C428") 'copies value of m_cond_per_hour to Table

Next i

End Sub
```

Read the comments in the above code to know what each line does.

4. Now, click on the CommandButton3 and immediately the calculations are done and the Table is filled up:

432	To plot h_avg, Q and m_cond against T_s:			
433				
434	T_s_lower=	15	C	
435	T_s_higher=	36	C	CommandButton3
436	You may change T_s such that: T_s higher < 45 and T_s_lower > 0, Then click CommandButton3.			
437				
438	T_s (deg.C)	h_avg (W.m <sup>2</sup> .C)	Q (W)	m_cond_per_hour (kg/h)
439	15	5115.017	475291.304	689.929
440	18	5298.407	444393.233	647.304
441	21	5501.440	411646.348	601.680
442	24	5734.516	377201.641	553.249
443	27	6007.410	340798.132	501.597
444	30	6327.369	301700.556	445.604
445	33	6723.455	259754.282	384.996
446	36	7247.254	214419.168	318.922

5. Now, plot  $m_{cond}$  against  $T_s$ :

6. Now, we can easily change the range of  $T_s$  as we desire, by changing cells C434 and C435. **As an example, for  $T_s$  between the limits 10 and 40 C:** Change cells C434 and C435 as shown and click CommandButton3 and we get:

	A	B	C	D	E
432		To plot $h_{avg}$ , Q and $m_{cond}$ against $T_s$ :			
433					
434		$T_{s\_lower} =$	10	C	CommandButton3
435		$T_{s\_higher} =$	40	C	
436		You may change $T_s$ such that: $T_s$ higher < 45 and $T_{s\_lower}$ > 0, Then click CommandButton3.			
437					
438		$T_s$ (deg.C)	$h_{avg}$ (W.m <sup>2</sup> .C)	Q (W)	$m_{cond\_per\_hour}$ (kg/h)
439		10	4850.412	523846.512	756.077
440		14.28571429	5074.320	482441.042	699.735
441		18.57142857	5335.103	438276.570	638.814
442		22.85714286	5641.651	390538.681	572.053
443		27.14285714	6021.628	339010.287	499.048
444		31.42857143	6503.887	282095.465	417.343
445		35.71428571	7189.665	218910.618	325.493
446		40	8349.039	146296.424	218.624

And, the plot updates itself immediately:

efficiency      reliability      delivery

As a leading technology company in the field of geophysical science, PGS can offer exciting opportunities in offshore seismic exploration.

We are looking for new BSc, MSc and PhD graduates with Geoscience, engineering and other numerate backgrounds to join us.

A Clearer Image  
[www.pgs.com](http://www.pgs.com)

**Prob.3.2.28.** Consider a horizontal tube, 4 m long, 30 mm ID, maintained at a uniform temp of 110 C, inside which sat. steam at 2.701 bar condenses. Assuming low vap. velocity, find out the heat transfer and steam condensation rate.

**EXCEL Solution:**

Note that at 2.701 bar, sat. temp.  $T_{sat} = 130$  C

Let us write a VBA Function to calculate h, Q and m\_condensed for condensation of steam on inside a Horizontal cylinder:

```

-----
Function Condensation_In_HCyl_Steam(T_sat As Double, T_s As Double, D As Double, L As Double, U_v As Double) As Variant
'Condensation of Steam at T_sat inside a Horizl Cylinder held at T_s
'Input: T_sat, T_s (C), D, L (m), U_v (vap. velocity, m/s)
'Output: h_avg (W/m^2.C), Q (W) and mass_condensed (kg/s)
'Results are returned as an Array

Dim g As Double
Dim T_f As Double, h_fg As Double, rho_v As Double, mu_v As Double, Re_vap As Double

Dim rho_l As Double, mu_l As Double, nu_l As Double, k_l As Double, cp_l As Double, Pr_l As Double
Dim h_fg_prime As Double, h_avg As Double
Dim Q As Double, m_condensed As Double

If T_sat <= T_s Then
MsgBox ("T_sat must be > T_s !")
End
End If

g = 9.81 '[m/s^2]
T_f = (T_sat + T_s) / 2 'Avg. temp.

'Properties of liquid at Tf:

rho_l = 1 / SatH2O_vf_T(T_f + 273.15)
mu_l = SatH2O_muf_T(T_f + 273.15)
cp_l = SatH2O_cpf_T(T_f + 273.15)
k_l = SatH2O_kf_T(T_f + 273.15)
nu_l = mu_l / rho_l
Pr_l = SatH2O_Prf_T(T_f + 273.15)

'Properties of vapour and h_fg at Tsat:

rho_v = 1 / SatH2O_vg_T(T_sat + 273.15)
mu_v = SatH2O_mug_T(T_sat + 273.15)
h_fg = SatH2O_hfg_T(T_sat + 273.15)

```

```
'Calculations:
h_fg_prime = h_fg + (3 / 8) * cp_l * _
(T_sat - T_s) 'modified h_fg....takes care of nonlinear temp distribn and liq film subcooling

Re_vap = rho_v * U_v * D / mu_v '..Vapour Reynolds No...must be < 35000!!

If (Re_vap <= 35000) Then

h_avg = 0.555 * ((g * rho_l * (rho_l - rho_v) * h_fg_prime * k_l ^ 3) / _
(mu_l * (T_sat - T_s) * D)) ^ (1 / 4) '[W/m^2-C] .... avg internal heat tr coeff over L

ElseIf (Re_vap > 35000) Then

    MsgBox ("Re_vap must be <= 35000. Now, Re_vap =" & Re_vap)

End If

Q = h_avg * (Application.Pi() * D * L) * (T_sat - T_s) 'W

m_condensed = Q / h_fg_prime 'kg/s

Condensation_In_HCyl_Steam = Application.Transpose(Array(h_avg, Q, m_condensed))

End Function
```

Now, let us solve the above problem:

1. Set up the EXCEL worksheet, enter data:

	A	B	C	D
475				
476		<b>Data:</b>		
477		<b>T_sat</b>	<b>130.000</b>	<b>C</b>
478		<b>T_s</b>	<b>110.000</b>	<b>C</b>
479		<b>D</b>	<b>0.030</b>	<b>m</b>
480		<b>L</b>	<b>4.000</b>	<b>m</b>
481		<b>U_v</b>	<b>0</b>	<b>m/s...vap. Velocity</b>
482				

2. Set up the calculations for the condensation inside the horizl cylinder, using the Array Function just written:

	A	B	C	D
475				
476		Data:		
477		T_sat	130.000	C
478		T_s	110.000	C
479		D	0.030	m
480		L	4.000	m
481		U_v	0	m/s...vap. Velocity
482				
483				
484		h_avg		W/m^2.C
485		Q		W
486		m_cond		kg/s
487		m_cond_per_hour	0.000	kg/h

3. Select the cells C484, C485 and C486 and enter the Array Function:

Click OK. We get the following screen; fill it up as shown:

**IMPORTANT:** Now, press (Ctrl + Shift + Enter), since it is an Array Function. We get:

	A	B	C	D
476		Data:		
477		T_sat	130.000	C
478		T_s	110.000	C
479		D	0.030	m
480		L	4.000	m
481		U_v	0	m/s...vap. Velocity
482				
483				
484		h_avg	8066.522583	W/m^2.C
485		Q	60820.147408	W
486		m_cond	0.027578	kg/s
487		m_cond_per_hour	99.281	kg/h

Thus:

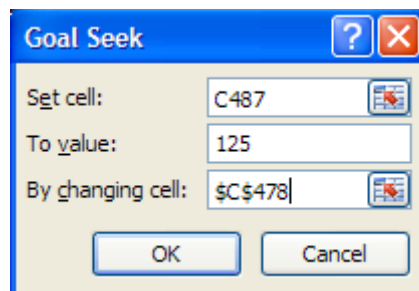

Heat transferred,  $Q = 60820.15 \text{ W} \dots \text{Ans.}$

Condensation rate =  $99.28 \text{ kg/h} \dots \text{Ans.}$

(b) What should be the surface temp,  $T_s$ , if we need to get a condensation rate of  $125 \text{ kg/h}$ ?

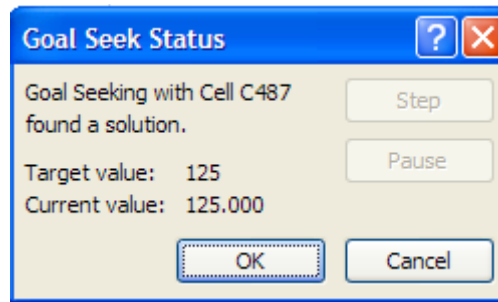

Use Goal Seek in EXCEL to make cell C487 to 125 by changing cell C478 (i.e. value of  $T_s$ ):

Click on: Data – WhatIf Analysis\_GoalSeek. We get the following screen; fill it up as shown:

Click OK:

## Technical training on *WHAT* you need, *WHEN* you need it

At IDC Technologies we can tailor our technical and engineering training workshops to suit your needs. We have extensive experience in training technical and engineering staff and have trained people in organisations such as General Motors, Shell, Siemens, BHP and Honeywell to name a few.

Our onsite training is cost effective, convenient and completely customisable to the technical and engineering areas you want covered. Our workshops are all comprehensive hands-on learning experiences with ample time given to practical sessions and demonstrations. We communicate well to ensure that workshop content and timing match the knowledge, skills, and abilities of the participants.

We run onsite training all year round and hold the workshops on your premises or a venue of your choice for your convenience.

For a no obligation proposal, contact us today at [training@idc-online.com](mailto:training@idc-online.com) or visit our website for more information: [www.idc-online.com/onsite/](http://www.idc-online.com/onsite/)

Email: [training@idc-online.com](mailto:training@idc-online.com)  
Website: [www.idc-online.com](http://www.idc-online.com)

Goal seek has found a solution. Again, click OK and see the new value of T<sub>s</sub> in cell C478:

	A	B	C	D
476		Data:		
477		T <sub>sat</sub>	130.000	C
478		T <sub>s</sub>	102.362	C
479		D	0.030	m
480		L	4.000	m
481		U <sub>v</sub>	0	m/s...vap. Velocity
482				
483				
484		h <sub>avg</sub>	7389.803180	W/m <sup>2</sup> .C
485		Q	76996.261555	W
486		m <sub>cond</sub>	0.034722	kg/s
487		m <sub>cond_per_hour</sub>	125.000	kg/h

Thus:

Surface temp required to get 125 kg/h of condensation rate is: T<sub>s</sub> = 102.36 C ... Ans.

=====

**VBA Functions for properties of Ammonia (NH<sub>3</sub>) (i.e. R717):**

Many times, we need properties of NH<sub>3</sub> at a given temp while solving problems on condensation. *But, EXCEL does not have built-in property functions for NH<sub>3</sub>.*

So, we shall use these Tables on properties of Sat. NH<sub>3</sub>, shown below and write Functions in VBA to find out various properties. The required properties are found at the given temp (in K) by interpolation.

Following are the steps:

1. First, enter the data table in EXCEL as shown below:

Ref: [https://www.thermafluidscentral.org/encyclopedia/index.php/Thermophysical\\_Properties:\\_Ammonia](https://www.thermafluidscentral.org/encyclopedia/index.php/Thermophysical_Properties:_Ammonia)

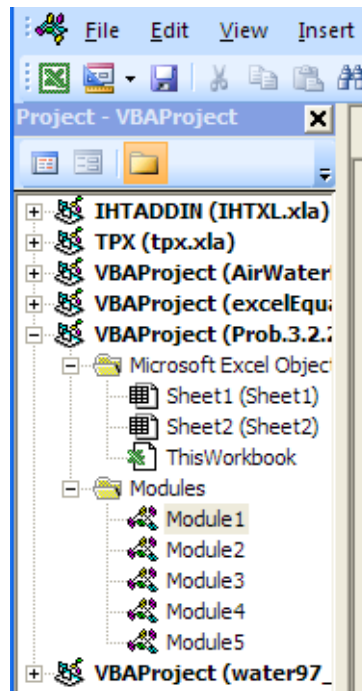

Thermophysical Properties: Ammonia											
Ammonia, NH <sub>3</sub> , Molecular Mass: 17.0, (T <sub>sat</sub> = 239.9 K; T <sub>m</sub> = 195.5 K)											
Temp. K	p <sub>v</sub> saturation pressure (10 <sup>5</sup> Pa)	h <sub>v</sub> latent heat (kJ/kg)	ρ <sub>l</sub> liquid density (kg/m <sup>3</sup> )	ρ <sub>v</sub> vapor density (kg/m <sup>3</sup> )	μ <sub>l</sub> liquid viscosity (10 <sup>-6</sup> N·s/m <sup>2</sup> )	μ <sub>v</sub> vapor viscosity (10 <sup>-6</sup> N·s/m <sup>2</sup> )	k <sub>l</sub> liquid thermal conductivity (W/m·K)	k <sub>v</sub> vapor thermal conductivity (W/m·K)	σ liquid surface tension a (10 <sup>-2</sup> N/m)	c <sub>p,l</sub> liquid specific heat (kJ/kg·K)	c <sub>p,v</sub> vapor specific heat a (kJ/kg·K)
200	0.008646	1477	728.9	0.08899	407	7.64	0.709	0	0	4.606	1.979
210	0.017746	1451	717.5	0.1746	369	8.02	0.685	0	0	4.375	2.033
220	0.033811	1425	705.8	0.319	334	8.4	0.661	0.0158	0	4.346	2.083

310	1.4235	1113	584.6	11.01	126	11.86	0.454	0.0302	18	4.909	3.428
320	1.8721	1066	568.2	14.51	113.4	12.29	0.431	0.0332	15.9	5.024	3.725
330	2.4196	1014	550.9	18.89	101.9	12.74	0.408	0.0368	13.7	5.17	4.088
340	3.0789	958	532.4	24.4	92.1	13.22	0.385	0.0415	11.7	5.366	4.545
350	3.8641	895	512.3	31.34	83.2	13.74	0.361	0.0467	9.6	5.639	5.144
360	4.7902	825	490.3	40.18	75.4	14.35	0.337	0.0536	7.67	6.042	5.978
370	5.874	745	465.5	51.65	68.5	15.07	0.313	0.0614	5.74	6.677	7.217
380	7.1352	649	436.5	67.16	61.1	15.96	0.286	0.07	3.98	7.795	9.312
390	8.5977	529	400.2	89.85	50.3	17.14	0.254	0.08	2.21	10.27	13.86

Note that temp range is: T = 200 K – 390 K.

2. Now, the various properties are required as a function of T. So, the VBA program we write will search for the temp in the column B and if it finds the exact match, it will return the required property by reading the same in that row. If the exact temp match is not available (this is the more likely scenario), it will locate two consecutive cells where one temp is lower than required T, and the other temp is higher than T. Also, the corresponding values of the property at these two temperatures are noted. Then, a linear interpolation is made between these two values of the property and the same is returned.
3. Now, write the VBA code. Go to Developer – Visual Basic –

Click on Visual Basic:

And, click on Module1, wherein VBA programs for properties of Air were written. Go to the end of that Module and write programs for NH3.

**TU Delft** Delft University of Technology  
Challenge the future

One example is shown below, for density of liquid, rho\_f:

```

(General) (Declarations)
Function SatNH3_rho_f_T(T As Double) As Double
'gives density of liq rho_f(kg/m^3) as a function of T (K) at sat. temp T(K)
'Reads rho_f values from Table and interpolates

Dim i As Integer

Dim T_1 As Double, T_2 As Double, rho_f1 As Double, rho_f2 As Double

If T < 200 Or T > 390 Then

MsgBox ("T must be between 200 K and 390 K !!")
End
End If

For i = 0 To 19

If Cells(96 + i, 13) = T Then
SatNH3_rho_f_T = Cells(96 + i, 16)
End If
If Cells(96 + i, 13) < T And Cells(96 + i + 1, 13) > T Then
T_1 = Cells(96 + i, 13).Value
T_2 = Cells(96 + i + 1, 13).Value
rho_f1 = Cells(96 + i, 16).Value
rho_f2 = Cells(96 + i + 1, 16).Value
SatNH3_rho_f_T = (rho_f1 + (T - T_1) * (rho_f2 - rho_f1) / (T_2 - T_1))
End If

Next i

End Function

```

In the above code:

1st line: declares name of the function, with dimensions of variables involved

Lines 2, 3: comments – explain about the Function

Line 4, 5: declarations of dimensions of internal variables, i.e. variables available only inside the Function

Line 6 to 9: If statement to give an error message if value of T entered is beyond the values available in the Table

Line 10: Beginning of For...Next construct. Note that the construct will search in the 20 lines of the Table

Lines 11, 12, 13: If the exact match for T is found, Function returns the value of 'rho' in the column P

Lines 14 to 20: If the exact match of  $T$  is not there in the Table, then locate the values of  $T$  just below  $T$  and just above  $T$ , and name them as  $T_1$  and  $T_2$ . Also, note the corresponding values of  $\rho$  as  $\rho_{f1}$  and  $\rho_{f2}$ . And, then, calculate the value of  $\rho$  at the required  $T$  by interpolation.

Line 21: Go to the next  $i$  in the loop

Line 22: End statement of Function.

4. Similar Functions are written for other properties of  $\text{NH}_3$ , as functions of  $T$ . i.e.

For density of vap....SatNH3\_rho\_g\_T(T)

For th. conductivity of liq....SatNH3\_k\_f\_T(T)

For th. conductivity of vap....SatNH3\_k\_g\_T(T)

For sp. heat of liq....SatNH3\_cp\_f\_T(T)

For sp. heat of vap....SatNH3\_cp\_g\_T(T)

For surface tension....SatNH3\_sigma\_f\_T(T)

For dynamic viscosity of liq....SatNH3\_mu\_f\_T(T)

For dynamic viscosity of vap....SatNH3\_mu\_g\_T(T), and

For heat of vaporization of liq....SatNH3\_h\_fg\_T(T)

---

Now, using these VBA Functions for properties of  $\text{NH}_3$ , write Functions for condensation of Sat  $\text{NH}_3$  on vertical plates, vertical cylinders, Horizl cylinder, Tube bank with horizl tubes in a vertical tier, condensation inside horizontal cylinder etc.

One example of a VBA program for **condensation of NH3 on the outside of a horizl cylinder** is shown below:

```

Function Condensation_on_HCyl_NH3(T_sat As Double, T_s As Double, D As Double, L As Double) As Variant
'Condensation of NH3 at T_sat on a Horizl Cylinder held at T_s
'Input: T_sat, T_s (C), D, L (m)
'Output: h_avg (W/m^2.C), Q (W) and mass_condensed (kg/s)
'Results are returned as an Array

Dim g As Double
Dim T_f As Double, h_fg As Double, rho_v As Double

Dim rho_l As Double, mu_l As Double, nu_l As Double, k_l As Double, cp_l As Double, Pr_l As Double
Dim h_fg_prime As Double, h_avg As Double
Dim Q As Double, m_condensed As Double

If T_sat <= T_s Then
MsgBox ("T_sat must be > T_s !")
End
End If

g = 9.81 '[m/s^2]
T_f = (T_sat + T_s) / 2 'Avg. temp.

'Properties of liquid at Tf:

rho_l = SatNH3_rho_f_T(T_f + 273.15)
mu_l = SatNH3_mu_f_T(T_f + 273.15)
cp_l = SatNH3_cp_f_T(T_f + 273.15)
k_l = SatNH3_k_f_T(T_f + 273.15)
nu_l = mu_l / rho_l
Pr_l = cp_l * mu_l / k_l

'Properties of vapour and h_fg at Tsat:

rho_v = SatNH3_rho_g_T(T_sat + 273.15)
h_fg = SatNH3_h_fg_T(T_sat + 273.15)

'Calculations:

h_fg_prime = h_fg + 0.68 * cp_l * _
(T_sat - T_s) 'modified h_fg....takes care of nonlinear temp distribn and liq film subcooling

h_avg = 0.729 * ((g * rho_l * (rho_l - rho_v) * h_fg_prime * k_l ^ 3) / _
(mu_l * (T_sat - T_s) * D)) ^ (1 / 4) '[W/m^2-C] .... avg heat tr coeff over L

Q = h_avg * (Application.Pi() * D * L) * (T_sat - T_s) 'W

m_condensed = Q / h_fg_prime 'kg/s

Condensation_on_HCyl_NH3 = Application.Transpose(Array(h_avg, Q, m_condensed))

End Function

```

Now, the above program is an Array Function and returns  $h_{avg}$ ,  $Q$  and  $Mass\_condensed$  in a vertical array.

**Let us solve a problem using this Function:**

**Prob. 3.2.29.** Sat.  $NH_3$  vapour at 10 C condenses on the outside of a 2 cm OD, 5 m long horizontal tube whose outer surface is maintained at -10 C. Determine: (a) rate of heat transfer (b) rate of condensation of  $NH_3$ .

"I studied English for 16 years but...  
...I finally learned to speak it in just six lessons"

Jane, Chinese architect

**EXCEL Solution:**

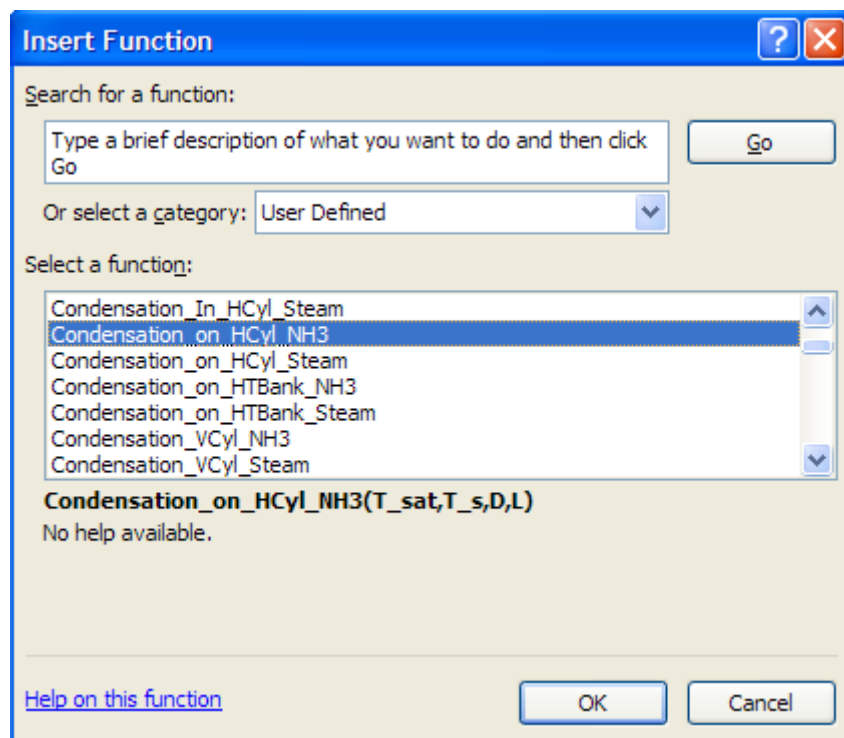

We shall use the VBA program written above for condensation on a horizl tube:

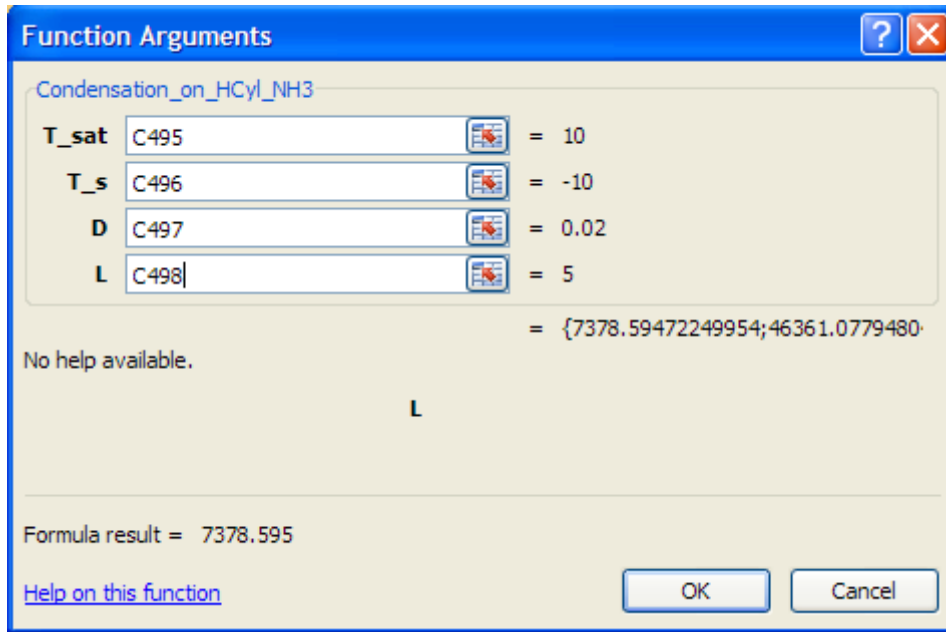

Following are the steps:

1. Set up the EXCEL worksheet, enter data:

	A	B	C	D
493				
494		<b>Data: Fluid: Ammonia</b>		
495		T_sat	10.000	C
496		T_s	-10.000	C
497		D	0.020	m
498		L	5.000	m
499				
500				
501				
502		h_avg		W/m^2.C
503		Q		W
504		m_cond		kg/s
505		m_cond_per_hour	0.000	kg/h

2. Select cells C502to C504 and enter the Array Function for condensation of NH3 on the outside of a horizontal cylinder. Remember to press (Ctrl + Shift + Enter) after selecting the Function from the ‘User Defined’ category, and entering the required parameters for the Function:

Press (Ctrl+Shift+OK) since it is an Array Function, and we get:

	A	B	C	D
493				
494		Data: Fluid: Ammonia		
495		T_sat	10.000	C
496		T_s	-10.000	C
497		D	0.020	m
498		L	5.000	m
499				
500				
501				
502		h_avg	7378.595	W/m^2.C
503		Q	46361.078	W
504		m_cond	0.036008	kg/s
505		m_cond_per_hour	129.630	kg/h
506				

Thus:

$h_{avg} = 7378.6 \text{ W/m}^2.C \dots \text{Ans.}$

$Q = 46361.1 \text{ W} \dots \text{Ans.}$

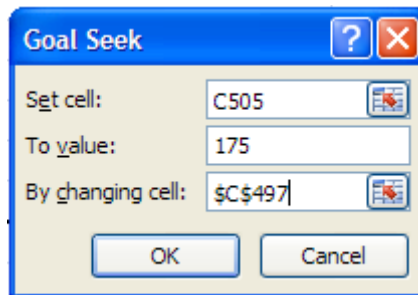

$m_{cond\_per\_hour} = 129.63 \text{ kg/h} \dots \text{Ans.}$

**(b) What should be the diameter if we need to have a condensation rate of 175 kg/h?**

This is easily calculated by applying Goal seek to cell C505 (i.e. m\_cond\_per\_hour) to make it 175 by changing cell C497 (i.e. D).

The procedure is:

Go to Data – WhatIf Analysis – Goal Seek Click on Goal Seek. We get the following screen; fill it up as shown:

Study at one of Europe's leading universities

DTU, Technical University of Denmark, is ranked as one of the best technical universities in Europe, and offers internationally recognised Master of Science degrees in 39 English-taught programmes.

DTU offers a unique environment where students have hands-on access to cutting edge facilities and work

closely under the expert supervision of top international researchers.

DTU's central campus is located just north of Copenhagen and life at the University is engaging and vibrant. At DTU, we ensure that your goals and ambitions are met. Tuition is free for EU/EEA citizens.

Visit us at [www.dtu.dk](http://www.dtu.dk)

Click OK. We get:

Goal Seek has found a solution. Again, click OK and see the result in cell C497:

	A	B	C	D
493				
494		Data: Fluid: Ammonia		
495		T_sat	10.000	C
496		T_s	-10.000	C
497		D	0.0298	m
498		L	5.000	m
499				
500				
501				
502		h_avg	6676.197	W/m^2.C
503		Q	62587.419	W
504		m_cond	0.048611	kg/s
505		m_cond_per_hour	175.000	kg/h

**Thus: Value of D required to get a condensation rate of 175 kg/h = 0.0298 m ... Ans.**

**Note that correspondingly, values of h\_avg and Q also have changed.**

=====

**VBA Functions for properties of Refrigerant R134a:**

R134a is a substitute for R12, since R12 is phased out due to its contribution to ozone layer depletion. *But, EXCEL does not have built-in property functions for R134a.*

So, we shall use these Tables on properties of Sat. R134a, shown below and write Functions in VBA to find out various properties. The required properties are found at the given temp (in K) by interpolation.

Following are the steps:

1. First, enter the data table in EXCEL as shown below:

	M	N	O	P	Q	R	S	T	U	V	W	X
117	Ref: <a href="https://www.thermofluidscentral.org/encyclopedia/index.php/Thermophysical_Properties:_Freon%C2%AF-134a">https://www.thermofluidscentral.org/encyclopedia/index.php/Thermophysical_Properties:_Freon%C2%AF-134a</a>											
118	<b>Thermophysical Properties: Freon®-134a</b>											
119												
120	Freon-134a, CF3CH2F, Molecular Mass: 102.0, (T <sub>sat</sub> = -26.4°C; T <sub>m</sub> = -101 °C)											
	TTemp. K	$p_v$ saturation pressure (10 <sup>5</sup> Pa)	$h_{lv}$ latent heat (kJ/kg)	$\rho_L$ liquid density (10 <sup>3</sup> kg/m <sup>3</sup> )	$\rho_v$ vapor density (kg/m <sup>3</sup> )	$\mu_L$ liquid viscosity (10 <sup>-3</sup> N-s/m <sup>2</sup> )	$\mu_v$ vapor viscosity (10 <sup>-7</sup> N-s/m <sup>2</sup> )	$k_L$ liquid thermal conductivity (W/m-K)	$k_v$ vapor thermal conductivity (W/m-K)	$\sigma$ liquid surface tension (10 <sup>-3</sup> N/m)	$c_{p,L}$ liquid specific heat (kJ/kg-K)	$c_{p,v}$ vapor specific heat (kJ/kg-K)
122	213	0.1591	237.95	1.474	0.9268	0.663	83	0.121	0.00656	20.8	1.223	0.692
123	233	0.5121	225.86	1.418	2.769	0.472	91.2	0.111	0.00817	17.6	1.255	0.749
124	253	1.3273	212.91	1.358	6.785	0.353	99.2	0.101	0.00982	14.51	1.293	0.816
125	273	2.928	198.6	1.295	14.428	0.271	107.3	0.092	0.01151	11.56	1.341	0.897
126	293	5.7171	182.28	1.225	27.778	0.211	115.81	0.0833	0.01333	8.76	1.405	1.001
127	313	10.166	163.02	1.147	50.075	0.163	125.5	0.0747	0.01544	6.13	1.498	1.145
128	333	16.818	139.13	1.053	81.413	0.124	137.9	0.0661	0.01831	3.72	1.66	1.387

Note that temp range is: T = 213 K – 333 K.

2. Now, the various properties are required as a function of T. So, the VBA program we write will search for the temp in the column B and if it finds the exact match, it will return the required property by reading the same in that row. If the exact temp match is not available (this is the more likely scenario), it will locate two consecutive cells where one temp is lower than required T, and the other temp is higher than T. Also, the corresponding values of the property at these two temperatures are noted. Then, a linear interpolation is made between these two values of the property and the same is returned.
3. Now, write the VBA code. Go to Developer – Visual Basic –

Click on Visual Basic:

And, click on Module1, wherein VBA programs for properties of Air, NH3 etc. were written. Go to the end of that Module and write programs for R134a.

**MSM**

the globally networked management school

One example is shown below, for density of liquid, rho\_f:

```
Function R_134a_rho_f_T(T As Double) As Double
'gives rho_f of R134a (kg/m^3) as a function of T (K) at sat. temp T(K)
'Reads rho_f values from Table and interpolates

Dim i As Integer

Dim T_1 As Double, T_2 As Double, rhof1 As Double, rhof2 As Double

If T < 213 Or T > 333 Then

    MsgBox ("T must be between 213 K and 333 K !!")

    End

End If

For i = 0 To 6

    If Cells(122 + i, 13) = T Then
        R_134a_rho_f_T = Cells(122 + i, 16) * 10 ^ 3
    End If
    If Cells(122 + i, 13) < T And Cells(122 + i + 1, 13) > T Then
        T_1 = Cells(122 + i, 13).Value
        T_2 = Cells(122 + i + 1, 13).Value
        rhof1 = Cells(122 + i, 16).Value
        rhof2 = Cells(122 + i + 1, 16).Value
        R_134a_rho_f_T = (rhof1 + (T - T_1) * (rhof2 - rhof1) / (T_2 - T_1)) * 10 ^ 3
    End If

Next i

End Function
```

---

In the above code:

1st line: declares name of the function, with dimensions of variables involved

Lines 2, 3: comments – explain about the Function

Line 4, 5: declarations of dimensions of internal variables, i.e. variables available only inside the Function

Line 6 to 9: If statement to give an error message if value of T entered is beyond the values available in the Table

Line 10: Beginning of For...Next construct. Note that the construct will search in the 7 lines of the Table

Lines 11, 12, 13: If the exact match for T is found, Function returns the value of 'rho' in the column P

Lines 14 to 20: If the exact match of  $T$  is not there in the Table, then locate the values of  $T$  just below  $T$  and just above  $T$ , and name them as  $T_1$  and  $T_2$ . Also, note the corresponding values of  $\rho$  as  $\rho_{f1}$  and  $\rho_{f2}$ . And, then, calculate the value of  $\rho$  at the required  $T$  by interpolation.

Line 21: Go to the next  $i$  in the loop

Line 22: End statement of Function.

4. Similar Functions are written for other properties of R134a, as functions of  $T$ . i.e.

For density of vap....R134a\_rho\_g\_T(T)

For th. conductivity of liq....R134a\_k\_f\_T(T)

For th. conductivity of vap....R134a\_k\_g\_T(T)

For sp. heat of liq....R134a\_cp\_f\_T(T)

For sp. heat of vap....SatNH3\_cp\_g\_T(T)

For surface tension....R134a\_sigma\_f\_T(T)

For dynamic viscosity of liq....R134a\_mu\_f\_T(T)

For dynamic viscosity of vap....R134a\_mu\_g\_T(T), and

For heat of vaporization of liq....R134a\_hfg\_T(T)

---

Now, using these VBA Functions for properties of R134a, we can write Functions for condensation of R134a on vertical plates, vertical cylinders, Horizl cylinder, Tube bank with horizl tubes in a vertical tier, condensation inside horizontal cylinder etc.

One example of a VBA program for **condensation of R134a inside of a horizontal cylinder** is shown below:

```
Function Condensation_In_HCyl_R134a(T_sat As Double, T_s As Double, D As Double, L As Double, U_v As Double) As Variant
'Condensation of R134a at T_sat inside a Horizl Cylinder held at T_s
'Input: T_sat, T_s (C), D, L (m), U_v (vap. velocity, m/s)
'Output: h_avg (W/m^2.C), Q (W) and mass_condensed (kg/s)
'Results are returned as an Array

Dim g As Double
Dim T_f As Double, h_fg As Double, rho_v As Double, mu_v As Double, Re_vap As Double

Dim rho_l As Double, mu_l As Double, nu_l As Double, k_l As Double, cp_l As Double, Pr_l As Double
Dim h_fg_prime As Double, h_avg As Double
Dim Q As Double, m_condensed As Double

If T_sat <= T_s Then
MsgBox ("T_sat must be > T_s !")
End
End If

g = 9.81 '[m/s^2]
T_f = (T_sat + T_s) / 2 'Avg. temp.]

'Properties of liquid at Tf:

rho_l = R_134a_rho_f_T(T_f + 273.15)
mu_l = R_134a_mu_f_T(T_f + 273.15)
cp_l = R_134a_cp_f_T(T_f + 273.15)
k_l = R_134a_k_f_T(T_f + 273.15)
nu_l = mu_l / rho_l
Pr_l = cp_l * mu_l / k_l

'Properties of vapour and h_fg at Tsat:

rho_v = R_134a_rho_g_T(T_sat + 273.15)
h_fg = R_134a_hfg_T(T_sat + 273.15)
mu_v = R_134a_mu_g_T(T_sat + 273.15)

'Calculations:

h_fg_prime = h_fg + (3 / 8) * cp_l * _
(T_sat - T_s) 'modified h_fg....takes care of nonlinear temp distribn and liq film subcooling

Re_vap = rho_v * U_v * D / mu_v '..Vapour Reynolds No...must be < 35000!!

If (Re_vap <= 35000) Then

h_avg = 0.555 * ((g * rho_l * (rho_l - rho_v) * h_fg_prime * k_l ^ 3) / _
(mu_l * (T_sat - T_s) * D)) ^ (1 / 4) '[W/m^2-C] .... avg internal heat tr coeff over L

ElseIf (Re_vap > 35000) Then

MsgBox ("Re_vap must be <= 35000. Now, Re_vap =" & Re_vap)

End If
```

```
Q = h_avg * (Application.Pi() * D * L) * (T_sat - T_s) 'W  
m_condensed = Q / h_fg_prime 'kg/s  
Condensation_In_HCyl_R134a = Application.Transpose(Array(h_avg, Q, m_condensed))  
End Function
```

---

Now, the above program is an Array Function and returns h\_avg, Q and Mass\_condensed inside a horizontal cylinder.

**Let us solve a problem using this Function:**

**Prob. 3.2.30.** Sat. R134a vapour at 30 C condenses inside a horizontal tube of 1 cm ID, 5 m long and the tube surface is maintained at 20 C. Determine: (a) rate of heat transfer (b) rate of condensation of R134a. Assume that the entering vapour has negligible velocity (i.e.  $U_v = 0$ ).

**EXCEL Solution:**

We shall use the VBA Function for condensation of R134a inside a horizontal cylinder, written above.

**gaiteye**

1. Set up the EXCEL worksheet for this problem. Remember that the Function we are going to use is an Array Function:

	A	B	C	D
514				
515		Data: Fluid: R134a		
516		T_sat	30.00	C
517		T_s	20.00	C
518		D	0.01	m
519		L	5.000	m
520		U_v	0.0	m/s
521				
522				
523		h_avg		W/m^2.C
524		Q		W
525		m_cond		kg/s
526		m_cond_per_hour	0.000	kg/h

2. Select the cells C523 to C525 and select the Array Function for condensation of R134a inside a horizontal cylinder from the 'User Defined' category:

We have:

Click OK. We get the following screen. Fill it up as shown:

526		m_cond_per_hour	50.252	kg/h

Thus:

$h_{avg} = 1580.59 \text{ W/m}^2.C \dots \text{Ans.}$

$Q = 2482.79 \text{ W} \dots \text{Ans.}$

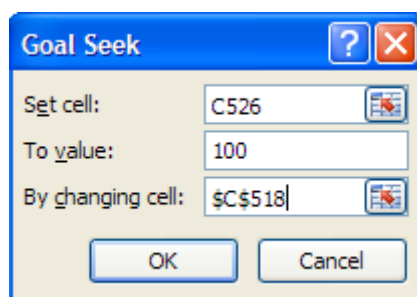

$m_{cond\_per\_hour} = 50.252 \text{ kg/h} \dots \text{Ans.}$

(b) What should be the diameter if we need to have a condensation rate of 100 kg/h?

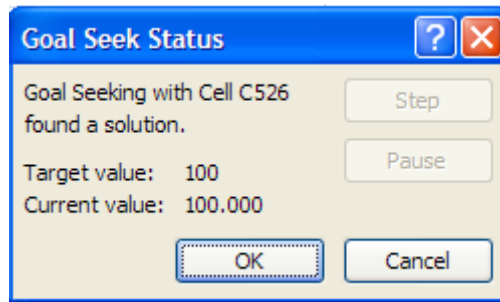

This is easily calculated by applying Goal seek to cell C526 (i.e. m\_cond\_per\_hour) to make it equal to 100 by changing cell C518 (i.e. D).

The procedure is:

Go to Data-WhatIf Analysis- Goal Seek Click on Goal Seek. We get the following screen; fill it up as shown:

Click OK. We get:

Goal Seek has found a solution. Again, click OK and see the result in cell C518:

	A	B	C	D
514				
515		Data: Fluid: R134a		
516		T_sat	30.00	C
517		T_s	20.00	C
518		D	0.03	m
519		L	5.000	m
520		U_v	0.0	m/s
521				
522				
523		h_avg	1256.624	W/m^2.C
524		Q	4940.657	W
525		m_cond	0.027778	kg/s
526		m_cond_per_hour	100.000	kg/h

**Thus: Value of D required to get a condensation rate of 100 kg/h = 0.03 m ... Ans.**

**Note that correspondingly, values of h\_avg and Q also have changed.**

**Day one**  
and you're ready

Day one. It's the moment you've been waiting for. When you prove your worth, meet new challenges, and go looking for the next one. It's when your dreams take shape. And your expectations can be exceeded. From the day you join us, we're committed to helping you achieve your potential. So, whether your career lies in assurance, tax, transaction, advisory or core business services, shouldn't your day one be at Ernst & Young?

**What's next for your future?**
